*From an Act prescribing Rules for the Government of the State Library,  
passed March 8th, 1861.*

Section 11. The Librarian shall cause to be kept a register of all books issued and returned; and all books taken by the members of the Legislature, or its officers, shall be returned at the close of the session. If any person injure or fail to return any book taken from the Library, he shall forfeit and pay to the Librarian, for the benefit of the Library, three times the value thereof: and before the Controller shall issue his warrant in favor of any member or officer of the Legislature, or of this State, for his per diem, allowance, or salary, he shall be satisfied that such member or officer has returned all books taken out of the Library by him, and has settled all accounts for injuring such books or otherwise.

Sec. 15. Books may be taken from the Library by the members of the Legislature and its officers during the session of the same, and at any time by the Governor and the officers of the Executive Department of this State who are required to keep their offices at the seat of government, the Justices of the Supreme Court, the Attorney-General, and the Trustees of the Library.

## TABLE OF CONTENTS.

Gaston's New Grinder and Amalgamator—Illustration	1
A Word to Readers in the Atlantic States	1
Progress of Metallurgy and Saving of Fuel	2
Process of Roasting Ores	2
Dall's Mill	2
American Chilled Iron	2
Mechanical—Gas Engines vs. Steam; The Syphon, Suggestions by Prof. Brower; Advantages of Steam Power; Cement and Tar	3
Scientific—The Oldest Land; Meridional Difference in Time; An Artificer's Night Light; Sugar from Coal; The Cause of Fever and Ague	3
Weekly Stock Circular	3
The Use of Iron Sponge for the Reduction of Metallic Sulphurates, Phosphates, Antimonides, etc.	4
New Patents and Inventions	4
Mining Sales of the Week	5
Mining Shareholders' Directory	5
San Francisco Stock and Exchange Board	5
San Francisco Market Rates	5
The Yacht Race	5
Mining Summary—California, Nevada, Oregon, Idaho, Colorado, Arizona, Montana, New Mexico, and British Columbia	6
Notices to Correspondents	6
Volume Fourteenth	8
Rittinger's Funnel or Powder Boxes	8
List of Officers of Corporations and Mining Companies	9
City Amusements	9
Rights of Foreigners Holding French Patents	10
Australian Gold at the Paris Exhibition	11
Col. Buel's Mine and Mill	14
Copper in Nevada	14
Utilization of Peat	16

## A WORD TO READERS IN THE ATLANTIC STATES.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into.

**THE MARIPOSA COMPANY** has obtained a temporary injunction against the further control of the property of the company by Dodge Bros., of this city. The company complain that the said firm have not kept good faith with them, inasmuch as the assignment was made with the understanding that the debts of the company were to be paid out of the proceeds of the working of the mines on the estate; whereas the firm has been buying up the debts at a discount, and now demand that the company should pay gold in full. The damages claimed are from \$200,000 to \$300,000. A receiver has been appointed.

**THE PIONEERS.**—We have received a copy of the constitution and by-laws of the Society of California Pioneers, as revised and adopted in October, 1866. The publication also contains the lists of officers annually elected since the organization of the society in 1850, together with a full list of members from that date.

## GASTON'S NEW GRINDER AND AMALGAMATOR.

Improvements never cease; and we hail with pleasure any real improvement in machinery for extracting the precious metals from their ores, because every improvement in that direction adds directly and materially to the wealth and prosperity of the whole Pacific coast.

Persons interested in quartz and cement mills, would do well to examine the principles of Mr. H. A. Gaston's Screw Grinder and Amalgamator, an illustration of which is given herewith, before concluding their purchases of amalgamating machinery for their mills.

The working of this pan differs, in manner, from any other in use. The mullers C, C, consist of a screw with broad flanges or threads (similar to a propeller screw),

and forms a layer or strata of quicksilver upon the bottom of the pan. The revolution of the screw produces a strong downward and under current of the pulp, drawing it down between the threads in four broad sheets, when the shoes effectually rub it into the quicksilver; after which it passes out of the cylinder through the spaces in its base, and is forced up between the outside of the cylinder and the inside of the pan and over the top of the cylinder, when it is again drawn down by the screw and rubbed into the quicksilver, and so on indefinitely.

In this manner a constant circulation of all the pulp in the pan is kept up, and alternately brought in contact with and rubbed into the quicksilver, and then forced from it, to be again returned with that precision attendant upon perfect machinery.

"THE SCREW GRINDER AND AMALGAMATOR."

which flanges overlap each other a short distance, to permit and compel a free passage of the pulp between them. The screw is about three feet in diameter, and revolves horizontally within a low, vertical cylinder, and the shoes for grinding, H, are attached to the base of the flanges or threads. Through the base of the cylinder are oblong holes or spaces, E, corresponding in size and number to the spaces between the threads of the screw. These permit the pulp to pass out from or into the cylinder. The revolution of the screw in either direction, causes the pulp to flow to the center of the pan and forces it between the shoes and the dies, thus adding the immense force of the screw to that of gravity, when rotated in one direction, and forcing to its aid a powerful atmospheric pressure when revolving in the opposite direction. In the ordinary pans gravity alone causes the pulp to pass beneath the mullers, while it is drawn to the center by guide blades intercepting the current of the pulp, caused by the revolution of the muller.

We are informed by the inventor that he does not grind quicksilver in his pan, but after the pulp has been ground to a proper fineness, the screw muller is raised a sixteenth, an eighth or a fourth of an inch, (the height being different with silver or gold ores,) and the quicksilver is poured in

The screw muller is the heart; the spaces in the cylinder are the arteries; the spaces between the cylinder and the sides of the pan are the veins of the system, while the pulp answers for the blood, and the circulation of this appears to be as perfect and as regular as in the human system.

With the screw amalgamator, it is calculated that settlers are not required; for the under current spoken of, draws the quicksilver and amalgam down beneath the screw and holds it there as closely and quietly as if in a tank.

The above includes the inventor's description and claims for this new pan, which we have thus fully given, because we consider it likely to prove a valuable improvement; and, for the further reason, that we take pleasure in contributing our meed of praise to the exertions and success of men of enterprise and genius.

One of these pans is now daily put in motion at the "Pacific Iron works," in this city, where the inventor, Mr. Gaston, will take pleasure in illustrating its movements to those interested in quartz and cement milling operations.

We understand that arrangements will soon be made for the manufacture of these pans at any of the foundries in this city, and we are informed, in the meantime, that persons desirous of negotiating for them

can do so by addressing the inventor, at the Cosmopolitan Hotel in this city, or R. L. Thomas, Esq., at Virginia City, Nevada.

**THE CHINA MAIL BANQUET.**—The first mail steamer of the new line to China and Japan, sailed as announced on New Year's Day. The occasion was duly celebrated by a grand banquet on the evening previous at the Occidental Hotel. Many of the San Francisco notables were present, representing in a highly creditable degree, the wealth and the intelligence of the city. The banquet hall was magnificently and tastefully arrayed, and was appropriately ornamented with the mingled devices characteristic of the two countries thus for the first time to be brought into intimate acquaintance with each other. Governor Low presided and Bishop Kip acted as chaplain. After the dinner—which was of course unexceptionable—had been duly discussed, when men were in the comfortable coffee and cigar state, which is said to usually succeed such a performance, came "the feast of reason and the flow of soul." In answer to toasts drank, speeches were made by General McDowell, Captain Eldridge, of the P. M. S. Company, Hall M'Allister, Ex-Governor Stanford, R. B. Swain, Rev. Dr. Stone, Rev. Horatio Stebbins, A. A. Low, Ex-President of the New York Chamber of Commerce; R. G. Sneath, President San Francisco Chamber of Commerce; Samuel L. Wilson, Fung Tang, one of our noted San Francisco Chinese merchants; W. H. L. Barnes, Samuel Williams, of the Bulletin; E. A. Rockwell, of the Call; Asher B. Bates, F. M. Pixley, and Governor McCormick, of Arizona. A congratulatory dispatch from the Mayor and Council of Placerville was read.

At three and a half o'clock the meeting was declared dissolved, and the guests separated, all on good terms with each other, with "the occasion," and with everybody else.

**SALT FOR THE PARIS EXHIBITION.**—Messrs. Winegar & Shaw, 308 and 310 Front street, have shown us four samples of salt which they have prepared to go forward by our Commissioner to Paris. No. 1 is a very fine specimen of Arizona rock salt, as clear as crystal, and some five inches in length. No. 2, "California Solar Evaporated Salt." No. 3, California salt ground in water after a peculiar method, by Messrs. W. & S.; and No. 4, Fine salt for table and dairy use. For the last article, Messrs. W. & S. have taken premiums for the last six years.

**ART AND NATURE.**—The Pacific Art Gallery, No. 28 Third street, in addition to some fine paintings, contains a small but select assortment of stuffed birds and animals worth seeing. Among the latter our attention was, perhaps, more particularly attracted to a large wild goat from Montana, a spotted deer of beauty, and rather a curious animal of the carnivorous order, known as the carcajon; possessed of an unusual degree of sagacity, it is seldom entrapped. Hence its rarity.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the facts and theories they advance.

[Written for the Mining and Scientific Press.]

## Progress of Metallurgy and Saving of Fuel.

MESSEURS. EDITORS.—It seems strange that with the abundance of ore we have in our mines, and the quantity of fuel at our command, we are still obliged to send ores abroad for reduction, and afterward buy the metals at such prices as the smelters may choose to place upon them. It must seem to outside observers that we neither possess the ores or fuel, so often mentioned in your valuable paper, or that we lack the knowledge of extracting the metals from the ores. Yet the fact is, we have both ores and talent in abundance; and having in our favor the expensive transport of ore to Europe and the metal back again, we surely ought to compete successfully with the foreign manufacturers, not only in gold, silver and copper ores, but in iron as well. If metallurgy had made no progress, and we had to resort to old modes of smelting, we still could retain the field; but if we take into consideration the improvements made in the saving of fuel by various inventions, foremost among which stands C. W. Siemens's, we shall find that we possess all we need in our midst if we only take advantage thereof.

Various experiments have been made in the way of smelting works in California, and as far as gold and silver ore is concerned, I believe I was the owner of the only successful works ever erected in this State. For copper ores various experiments have been made with very poor success. The parties engaged in those experiments here had some theoretical, but not the practical knowledge necessary to make the proper calculation for desired results; for if it had been otherwise, and they had formed a full knowledge of the fuel and ore which they expected to manipulate, they would not have spent their friends' money in vain, and destroyed all confidence in further enterprise.

The impression has gone out that, as the Antioch smelting works were a failure, Mount Diablo coal is not fit for smelting ores. To this I respectfully dissent by saying it makes but little difference with regard to the character of the coal, whether it be anthracite, bituminous, lignite, or even wood, peat or sawdust; any material containing hydro-carbon may be employed to raise as high a degree of heat as is necessary to smelt any metal or ore. All that is necessary is the proper knowledge of the fuel and its application; with that we need never fail to produce the degree of heat requisite to effect the reduction of the ores of metals. Few of our mineralogists have given this subject the proper attention it deserves; but men of the greatest ability, like Professor Faraday, have greatly ventilated the subject. I will give you a short abstract of what he has said on the subject of fuel, in connection with gas regenerating furnaces:

"Gaseous fuel is obtained by the mutual action of coal, air and water, at a moderate red heat. A brick chamber, perhaps six feet by twelve, and about ten feet high, is constructed with one of its end walls converted into a fire grate, *i. e.*, about half way down it is a solid plate, and for the rest of the distance consists of strong horizontal plate bars, where air enters, the whole being at an inclination, such as that which the side of a heap of coals would naturally take. Coals are poured through openings above, upon this combination wall and grate, and being fired at the under surface, they burn at the place where the air enters; but as the layer of coal is from two to three feet thick, various operations go on in those parts of the fuel which cannot burn, for want of air.

"Thus the upper and cooler part of the coal produces a large body of hydro-carbons; the cinders or coke which are not volatilized, approach, in descending, towards the grate; that part which is nearest the grate burns, with the entering air, into carbonic acid, and the heat evolved ignites the mass above it. The carbonic acid passes slowly through the ignited carbon, becomes converted into carbonic oxyd, and mingles in the upper part of

the chamber (or gas producer) with the former hydro-carbons. The water, which is purposely introduced at the bottom of the arrangement, is first vaporized by the heat and then decomposed by the ignited fuel, and re-arranged as hydrogen and carbonic oxyd; and only the ashes of the coal are removed, as solid matter from the chamber at the bottom of the fire bars.

"These mixed gases form the gaseous fuel. The nitrogen which enters with the air at the grate, is mingled with them, constituting about one-third of the whole volume. The gas rises up a large vertical tube, from twelve to fifteen feet, after which it proceeds horizontally for any required distance, and then descends to the heat regenerator, through which it passes before it enters the furnaces.

"A regenerator is a chamber packed with fire bricks, separated so as to allow of the free passage of air or gas between them. There are generally four of them placed under a furnace. The gas ascends through one of these chambers while air ascends through the neighboring chamber, and both are conducted through one end of the furnace where, mingled, they burn, producing the heat due to their chemical action. Passing onward to the other end of the furnace, they (the combined gases) find precisely similar outlets down which they pass; and traversing the two remaining regenerators from above downwards, heat them intensely, especially the upper part; and so travel on in their cooled state to the chimney.

"Now the passages between the four regenerators and the gas and air are supplied with valves and deflecting plates, which are like four way cocks in their action; so that by the use of a lever these regulators admit air or gas to the furnace.

"It is to be observed that the intensity of the heated flame, which leaves the furnace for the stack, always proceeds downwards through the regenerators; so that the upper part thereof is most intensely ignited, keeping back, as it does, the intense heat. So effectually is this accomplished, that the gases which enter the stack to be cast into the air, are not heated above three hundred degrees of Fahrenheit.

"It is considered that when the furnace is in full order, the heat carried forward to be evolved by the chemical action of combustion is about four thousand degrees, whilst that carried back by the regenerator is about three thousand degrees; making an intensity of power which, unless moderated, would fuse furnace and all else exposed to its action.

"Thus the regenerators are alternately heated and cooled by the outgoing and entering gases and air.

"Great facility is afforded in the management of a gas furnace. Not merely can the supply of gas and air to the furnace be governed by valves in the passages, but the very manufacture of the gas fuel itself can be diminished, or even stopped, by cutting off the supply of air to the grate of the gas producer; and this is important, inasmuch as there is no gasometer required.

"The economy in fuel is estimated practically as one-half, even when the cheapest kind of fuel is used. Carbon, when burnt perfectly into carbonic acid, in a gas producer, evolves about four thousand degrees of heat; but if burnt into carbonic oxyd, it only evolves twelve hundred degrees. The carbonic oxyd, in its fuel form, carries on with it the twenty-eight hundred degrees in chemical force which it evolves when burning in the real furnace, with a sufficient supply of air.

"The remaining twelve hundred degrees are employed in the gas producer, in distilling hydro-carbons, decomposing water, etc. The whole mixed gaseous fuel can evolve about four thousand degrees in the furnace, to which the regenerator can return about three thousand more."

In addition to the above, I can produce other statements, from more than fifty establishments where gas furnaces are used, and where a saving of more than 50 per cent. of fuel is effected. I have not only seen, but built and worked such furnaces; and if our people would adopt them for metallurgical operations, we should not be obliged to send any more ore to a foreign country for reduction.

In my next I will give you a description of the application of petroleum and coal tar for heating boilers, smelting and glass furnaces.

J. MOSHEIMER.

AN AVALANCHE.—A gang of Chiuamen at work on the Central Pacific Railroad, were buried by a snow-slide on the 22d December. Some four or five were dead when exhumed. The snow is from ten to fifteen feet deep on the Summit.

[Written for the Mining and Scientific Press.]

## PROCESS OF ROASTING ORES, ETC.

Translated from the German of F. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

## NUMBER FIVE.

3. *Matt*.—This mill product consists chiefly of  $\text{Fe}_2\text{S}_3$ ,  $\text{Fe}_2\text{S}$  in different proportions, so that either the  $\text{Fe}_2\text{S}_3$  is in larger proportions than the  $\text{Fe}_2\text{S}$ , or—which less frequently occurs—that the  $\text{Fe}_2\text{S}$  is in larger proportions than the  $\text{Fe}_2\text{S}_3$ . In the former case we may suppose the matt composed of  $x(\text{Fe}_2\text{S}_3, \text{Fe}_2\text{S}) + m(\text{Fe}_2\text{S}_3, \text{Fe}_2\text{S})$  and in the latter case as  $x(\text{Fe}_2\text{S}_3, \text{Fe}_2\text{S}) + (\text{Fe}_2\text{S}, n\text{Fe}_2\text{S}_3)$ , in which case, however, a small part of the protosulphide and subsulphide is sometimes replaced by other metals, as subsulphide of copper, sulphides of lead, zinc, manganese and silver; the matt also often contains slag mechanically combined, which, in a furnace matt containing sulphide of zinc, and consequently difficultly fusible, may often amount to twenty per cent. When ores consisting chiefly of pyrites, partly in a natural and partly in a roasted state, are smelted to a matt in a furnace, under a covering of slag, the sesquioxys of iron in the roasted part is reduced, at the expense of the sulphur of the raw part which escapes as a vapor to a protoxyd, and combines as such with the earthy materials forming a slag, which afterwards combines with the slag used as a covering.\* When the slaging (fluxing) is imperfect, which occurs when there is a lack of earthy material, particularly quartz, a part of the protoxyd of iron may be taken up by the matt, an oxy-sulphuret may be formed ( $n\text{Fe}_2\text{S}_2 + \text{Fe}_2\text{O}$ ) and a matt may be formed having the formula,  $m\text{Fe}_2\text{S}_2 + n\text{Fe}_2\text{O}$  ( $\text{S}_2, \text{O}$ ). If the ore was not free from other metals, which are likewise inclined to separate as sulphurets, they will be included in the compound.

Pulverized matt, when roasted, acts similar to magnetic pyrites. If it be roasted at a low temperature and with proper precautions at first, besides free sesquioxys of iron, considerable quantities of protosulphate is formed, which, afterwards, at an increased temperature, as in the case of that formed from magnetic pyrites, is changed to persulphate under evolution of sulphurous acid; the amount formed is about twenty-one per cent., having seven per cent. of sulphuric acid.

4. *Kupferkies* (copper pyrites)  $\text{Cu}_2\text{S}$ ,  $\text{Fe}_2\text{S}_3$  when roasted, acts similar to magnetic pyrites, except that besides a small quantity of persulphate of iron, a sulphate and free oxyd of copper is formed. If coarsely pulverized, copper pyrites be roasted at a dark-red heat and constantly stirred, and atmospheric air admitted until the smell of sulphurous acid disappears, it changes to a spongy powder, which, when cooling, changes to a dark red color. This powder consists chiefly of sesquioxys of iron, a suboxyd and protoxyd of copper, and contains protosulphate and persulphate of iron, and sulphate of copper—the latter in considerable quantities. If this product be now submitted to a bright red heat, and air admitted, the protosulphate of iron (as in the case of pyrites and magnetic pyrites) changes to persulphate; and there remains, besides the sesquioxys of iron and the protoxyd of copper, only sulphate of copper and a little persulphate of iron with twenty per cent. of sulphuric acid. If the temperature be still increased, these sulphates are decomposed, leaving the free oxyds of iron and copper, the sulphuric acid escaping partly as such, and partly as sulphurous acid and oxygen.

5. *Kupferstein* (copper matt). This mill product, when containing a high percentage of copper, consists principally of  $m\text{Cu}_2\text{S}$ ,  $\text{Fe}_2\text{S}_3$ ; when containing a medium percentage of copper  $\text{Cu}_2\text{S}$ ,  $\text{Fe}_2\text{S}_3$ ; and when having a low percentage,  $m(\text{Cu}_2\text{S}, \text{Fe}_2\text{S}_3) + \text{Fe}_2\text{S}$ , or in the latter case is a mixture of copper matt  $m\text{Cu}_2\text{S}$ ,  $\text{Fe}_2\text{S}_3$  with iron matt  $\text{Fe}_2\text{S}_2$ ,  $\text{Fe}_2\text{S}$ , in variable proportions, so that a copper matt, with a very low percentage of copper, may have the composition  $(\text{Cu}_2\text{S}, \text{Fe}_2\text{S}_3) + \text{Fe}_2\text{S}$ . The copper matt sometimes contains other sulphur metals, as lead, zinc, manganese and silver, which replace one another; and is not always free from a mixture of sulphide of antimony or arsenic, which unite with the disulphide of copper, and pass into the matt.

When pulverized copper matt is exposed to a dark red heat, and air admitted, it glows readily in consequence of the oxydation of its components; at first it is converted into suboxyd of copper, sesquioxys and protosulphate of iron, sulphurous acid

\*When a part of the sesquioxys has been reduced only to magnetic oxyd (sesquioxys plus protoxyd), and is present in any quantity, it crystallizes in beautiful glistening octahedrons, if the slag, in a large mass, be allowed to cool slowly.

passing off; but after the sulphides, being kept constantly stirred, have been mostly oxydized, and the temperature increased decomposing the protosulphate of iron, it is converted into free oxyd of copper and sesquioxys of iron, with sulphate of copper and persulphate of iron, having about eighteen per cent. of sulphuric acid; by continued roasting and constant stirring, the sulphates of copper and iron—the former only at a bright red heat—are decomposed, leaving free oxyds, while sulphurous acid, oxygen and sulphuric acid pass off—the latter in the form of white vapors.

6. *Bleiglanz* (sulphide of lead)  $\text{Pb}_2\text{S}$ , when pulverized and exposed to a dark red heat, air being admitted, glows of itself in consequence of the oxydation, evolves sulphurous acid, and at a continued dark red heat is converted into sulphate and free oxyd of lead. A higher temperature, not sufficient, however, to cause a sintering or smelting of the free oxyd, produces no further change, for the reason that the sulphate formed during the roasting cannot be decomposed and converted into free oxyd. As the proportion between the sulphate and free oxyd varies in proportion to the amount of other metals present, this portion of our subject will be treated more fully further on, when we come to explain the chemical changes which take place in the roasting of sulphur metals.

7. *Wismuthglanz* (sulphuret of bismuth)  $\text{Bi}_2\text{S}_3$ . In a powder, when heated on a clay saucer in a muffle, just to redness, air being admitted, glows of itself, evolves sulphurous acid, and is very soon converted into a light grey powder without sintering (caking). This powder consists of an oxyd and sulphate of bismuth. If the substance contained copper pyrites, the product when cool has a dark yellowish green color. If this be heated in a glass tube to a bright red, it melts, with the evolution of a little sulphuric acid, to a light brownish grey mass, which on the edges is translucent.

8. *Zinkblend* (sulphuret of zinc), yellow and brown,  $\text{Zn}_2\text{S}$  and Black  $\text{Fe}_2\text{S}_3 + 3\text{ZnS}$ , is, of all sulphur metals which require to be treated by fire, the most difficult to roast. Even when in a fine powder, it requires an uninterrupted red heat and strong draught of air for its complete oxydation, under which circumstances sulphurous acid is evolved, while free oxyd and more or less sulphate of zinc (neutral and basic) is formed. If the blend contains iron sulphuret, either as a component (blackjack) or as an admixture, this is converted into free sesquioxys. If, during the roasting, the temperature be kept pretty high, but a small quantity of neutral sulphate of zinc is formed, and that which has been already formed at a lower temperature, in large quantities, resolves itself into basic sulphate, evolving sulphuric acid, oxygen, and anhydrous sulphuric acid. The basic sulphate is decomposed to a free oxyd, only at a white heat. If the blend contains sulphide of cadmium, this acts in precisely the same manner as the sulphide of zinc.

9. Sulphuret of manganese,  $\text{Mn}_2\text{S}_2$  or  $\text{MnS}$ , found in combination with most of the sulphurets, and mill products from sulphur metals, when heated to a red heat and air admitted, is decomposed to sulphate and red oxyd of manganese; continued roasting at a red heat produces no change; at a higher temperature the sulphate formed is decomposed to sulphurous acid, oxygen, anhydrous sulphuric acid, and red oxyd.

[To be Continued.]

DALL'S MILL.—The loss of this mill by fire on the 21st December, was a serious affair. The Virginia Union says:

The ruin was complete, as not a fraction of machinery was saved. Whatever of amalgam or bullion was in pans, will of course be saved. Several hundred tons of ore were awaiting reduction. There was a large amount of salt in the mill, on storage, valued at \$12,000, which was badly damaged. The insurance on the mill amounted to \$15,000. There was about \$15,000 insurance on the outbuildings, which, however, were saved. The entire value of the mill was probably not less than \$150,000. We learn that Mr. Schamp, the superintendent, has, without any delay, leased the Ophir mill, and will immediately proceed to improve and fix it up after the style of the Dall mill.

AMERICAN CHILLED IRON.—Five American chilled railway wheels have arrived in London. They will be broken experimentally, and further wheels of this kind will be sent over for trial under English rolling stock. We have samples of the iron from which these wheels are cast, and it is of magnificent quality. The fracture is a rich dark gray, medium grained, and shows great toughness, the particles appearing to have been irregularly torn, rather than broken short off. The specific gravity ranges from 7.25 to 7.3185, and the tensile strength from 32,000 to 35,102 lbs., or say 14½ to 16 tons per square inch. The iron is that known as the Salisbury cold-blast charcoal iron, and is worth about £10 per ton in New York.—*Engineering*.

## Mechanical.

## Gas Engines vs. Steam.

The Lenoir gas engine still continues to grow in favor with the Parisians. According to the Gas Company's report for 1865, the total power represented by these engines, at that time in the city of Paris, was equal to 288 horses, consuming 20,342 feet of gas per hour of work, or about seventy-one feet per hour, per horse power. Many improvements have recently been introduced into their construction within the last two years. The convenience, neatness and noiseless operation of the machines is rendering their use quite popular, notwithstanding the cost of running them, over that required by steam.

Pierre Hagan, also of Paris, has recently perfected a very compact gas engine, for which several important advantages are claimed. This machine is protected by twelve patents, dated from 1858, onwards. One of these engines was recently set up in London, with which some careful experiments have been conducted, which are said to have been quite satisfactory. The gas, properly diluted with atmospheric air (about one of gas to nine of air) to produce an explosive mixture, is admitted and exploded, alternately above and below the piston-head, by an ingenious form of slide-valve, carrying suitable gas-burners. The gas is lighted at each half-stroke, by an exterior burner kept continuously burning. The cylinder is kept cool by a water jacket, through which cold water is constantly passing. It is said that careful experiments, with a consumption of 172 feet of gas per hour, show an actual force of two and one third horse power. It is claimed that Mr. Hagan's is the only gas engine that regularly and uninterruptedly works up to its nominal power; and it is maintained that the ignition of the gas by a gas jet, instead of by electricity, as used in the Lenoir Engine, is decidedly advantageous, inasmuch as electricity is a force quite too complicated for ordinary, every day use, and is also more expensive than the gas jet.

Gas engines, at a reasonable tariff for gas, are, perhaps, the best motors extant for obtaining small power—from  $1\frac{1}{2}$  to 3-horse. The dirt, trouble and danger attending steam are thereby obviated, and no expense whatever is incurred while the engine is idle; and the full power is available at a moment's notice, obtained and kept up by simply lighting an ordinary gas jet. The machine is stopped with the same facility. The first cost, we believe, is also less. The introduction of gas engines into all cities and crowded communities, is well worthy of consideration.

**ADVANTAGES OF STEAM POWER.**—Steam has recently been applied to the 60-ton crane, on the Newcastle Quayside, Gateshead, England. The crane is worked by two cylinders, ten inches in diameter, 14-inch stroke, bolted to the side frames. Formerly, when manual labor was employed in moving this ponderous mass with its load, it required about one hour to make a revolution by the aid of sixteen men. By the aid of steam it makes a complete revolution in three minutes, and loads of sixty tons can be run up at the rate of three and a half feet per minute, and swung round with the greatest ease by the attention of one man.

**A TALL CHIMNEY.**—The highest chimney in Cornwall, England, has recently been completed for the Par Metallurgical Works, and reaches an altitude of 237 feet. The stack is erected at a considerable distance from the furnaces, and the long flues are constructed so as to catch the valuable lead fumes that at present go off in smoke. It is calculated that in three years silver and arsenic enough may be collected in this way to reimburse the outlay in building the stack of flues. We believe there is a chimney in Scotland somewhat taller than this, and the tallest, if we mistake not, in the world.

## The Syphon—Suggestions from Prof. Brewer.

Professor W. H. Brewer, of the Sheffield Scientific School, connected with Yale College, furnishes us, in a private letter, the following interesting memoranda with reference to the use of the syphon:

"Since so much has been said upon the subject of the syphon in the Press, let me add a word. A mechanic who had put in a number of syphons at Well's Springs, a farm in New York, told me that the air could always be kept from accumulating at the highest portion of the pipe, if the current was swift enough to carry out the minute air-bubbles that formed by the diminished pressure; that if the current was stopped, or was too slow, the air would be liberated from solution, the same as when spring water is placed under the air-pumps; and that these bubbles would rise and soon cut off the stream of water.

"A patent was taken out some years ago, which claims to clear the pipe of air at the highest point, by another process, acting on the principle of the hydraulic ram. The stream was suddenly stopped and the momentum opened a valve at the top, discharging a little water and any air that might be there. Machines of this kind were advertised in the agricultural papers a few years ago. The advertisers proposed to raise water from wells in this way upon hillside farms. I know nothing of their success."

**CEMENT AND TAR.**—This has been used to a considerable extent, both in this country and Europe, to preserve mortar and brick work, or perhaps, more particularly, to render it impervious against moisture. Some English masons have started the idea that tar, instead of protecting destroys mortar, cement or bad bricks. It is more than probable that the material experimented with in England has been vegetable tar, which is quite a different thing from the mineral tar employed for such purposes in this country. The preservative qualities of the two substances may, very likely, be quite different.

**THE REVOLVING SHIP THEORY** is to be reduced to practice. It will be remembered that the invention consists of a ship so constructed as to roll over the surface of the water instead of being forced through it. A company has been formed in Baltimore to test its feasibility.

**POWER OF SIGHT IN BIRDS.**—The swallow, while flying at the rate of three miles a minute, is yet employed in looking up and down, right and left, for the minute insects on which it feeds, and which it captures and swallows without any diminution of the prodigious speed at which it is traveling.

**THE DENSITY OF THE MOON** is five-ninths less than that of the earth, while the second satellite of Jupiter appears, if we may place sufficient dependence on the determinations of magnitude and of mass, to be even actually denser than the great planet around which it revolves.

**Common phosphorus** bears, for twenty or thirty seconds without ignition, the action of a radiant heat at a focus where, in the fraction of a second, platinized platinum is raised to a white heat.

If the magnesia rock, used in the manufacture of cement, is calcined at too high a temperature, the hydraulicity of the material is destroyed. The product should be finely ground to improve the setting.

It is said that sands which are used as a filter for the purification of water, are effective in proportion as they contain the black oxyd of iron or magnetic carbide.

**A MR. GRAHAM** observes: "It is believed that metallic pores, and, indeed, all fine pores, are more accessible to liquids than to gases.

## Scientific Miscellany.

## The Oldest Land.

It appears that Canada is no longer entitled to be considered as the sole depository of the earliest fossil hitherto discovered, and thereby, in all probability, the first land which appeared above the primeval ocean. Recent laborious researches made by Prof. Hochstetter, of Vienna, have resulted in the discovery, in the calcareous limestone of the Krumman, of undoubted specimens of Eozoon, in all respects similar to those found in Canada. Moreover, the region of table land passing through Central Mexico, and extending northward through the great Utah Basin, is also beginning to attract much attention from geologists, by reason of its late and unexpected fossiliferous developments. It is more than probable that the waters of the Colorado may have drained the land upon whose desolate shores the original ocean first dashed its briny waters.

The study of the rocks, as developed in the fossiliferous remains of early animal and vegetable life, has taught the careful observer that the higher mountains, such as the Sierras, the Rocky Mountains, the Andes, the Alps, the Himalayas, etc., are of much more recent origin than the high table lands, or the lower mountain ranges. Agassiz has suggested the very possible theory that the thicker the crust of the earth where a mountain range has been elevated, the higher has usually been that elevation; hence, as a general rule, the oldest lands are supposed to be of moderate elevation only. This theory seems to be pretty fully substantiated in the cases already alluded to, of the regions bordering upon the St. Lawrence, the Colorado and the Krumman. The highest mountains are, most probably, the result of contractions of the earth's crust, rather than of elevating forces.

After the crust of the earth had become hardened, and the atmospheric temperature such as to allow of a condensation of the aqueous vapors upon the cooled surface, a contraction of the interior soon took place by which the crust became too large. In order to accommodate itself to its fluid interior, this crust became "waved," gradually rising in some portions and settling in others. The elevations formed the nucleus of future continents, while the water flowed naturally into the depressions, which then became the ocean floors. A longitudinal elevation of this kind is probably the origin of the high table lands already spoken of, extending through Mexico and Utah Territory; another probably extended along the eastern portion of the continent, from near the Gulf of Mexico to the mouth of the St. Lawrence, with its axis usually some four or five hundred miles from the present ocean line. Another of these elevations was probably formed through Central Europe and Asia. As a general thing, it was upon these elevations that the carboniferous formations were subsequently imposed.

The crust of the earth, at this time, was comparatively thin, and yielded with a less amount of fracture than at a subsequent period when the higher mountain ranges were formed. As already intimated, it is more than probable that the loftiest mountains have been the result of contraction rather than upheaval; that they have assumed their elevation at a comparatively recent period, and that such elevation is due quite as much, if not more, to the subsidence of valleys than the upheaval of the ridges. Along the lines of these fissures volcanic forces have found vent, which have ejected immense masses of lava, that have piled up the volcanic peaks which form the most striking features of all high mountain ridges.

Indeed, it is difficult to conceive of the possible generation of any force at all adequate to the upheaval of such mountain

masses, especially where there has been fifty or sixty miles or more of solid earth crust to break through; while upon the other theory the action of gravitation furnishes an ample solution of the problem. Under this theory, we should naturally look for the oldest lands at points of minor elevation, such as the Colorado Basin, etc., just where the fossiliferous records, as they are being gradually developed, are placing them.

**MERIDIONAL DIFFERENCE IN TIME.**—It is somewhat singular that the electric telegraph has not been employed to a greater extent than has been the case, in determining the difference of time between different meridional points. According to the New York Journal of Commerce, the difference of time between London and New York, as to-day established, was ascertained a number of years ago, by three chronometric voyages between London and Cambridge, Mass., and that between Cambridge and New York by telegraph. The accuracy of this determination, says the Journal, is about to be tested through the Atlantic Cable. If the difference between New York and San Francisco was ascertained by telegraph, it is not within our present recollection. The difference between London and New York, as now fixed, is four hours, fifty-five minutes, eighteen and ninety-five hundredths seconds. In the latitude of New York, the difference of meridional time is one second for every thousand and one hundred feet.

**AN ARTIST'S NIGHT LIGHT.**—An interesting conference on color as regards artificial light, has been given by M. Nickles, at Nancy. This professor spoke at great length on the power possessed by light (produced by the combustion of magnesium) to bring out certain natural as well as artificial colors with the identical brilliancy which they have by day. The presence of chloride of sodium in domestic lighting, he said, explains the impossibility of distinguishing certain shades of a dress, a flower, or a painting by night. A magnesium lamp, such as is used by photographers for night scenes, will bring out all the colors faithfully, and would permit of artists working at night with as much certainty as by daylight.

**SUGAR FROM COAL.**—Most of our readers have doubtless read that sugar has been obtained from coal; few, we presume, have believed the statement; yet it is true, at least in part, but only to the extent that a substance has been extracted from coal, which is chemically undistinguishable from sugar; but which, we presume, has no more the taste of sugar than spirits of turpentine has of the essence of lemon; both of which latter substances are, chemically, exactly alike—that is, composed of precisely the same chemical constituents. This phenomenon of chemical identity with dissimilarity of properties is due to the well known principle of isomerism.

**THE CAUSE OF FEVER AND AGUE.**—We have already, some time since, announced the fact that the fever and ague is now supposed to proceed from a certain plant or vegetable organization. This discovery was first announced by Dr. J. M. Salisbury. A recent number of the Journal of Medical Science speaks as follows of this discovery:

The real cause of fever and ague, in what are called malarious districts, is to be traced to a plant called the "Aqua Palmella," one of the lowest known forms of vegetable organism. The spores and oblong cells of this plant are, it seems, elevated by the exhalations rising up from the heated earth in the night, when the atmosphere has become cooler. The breathing in of these spores is said to be the cause of the fever and ague. Indeed, it would seem that they possess a powerful medical effect, useful to some—constitutions predisposed to consumption, for instance—yet destructive to others, through the fevers produced. It is supposed that, by proper arrangements, the knowledge of these facts will lead to the extirpation of the plants in many regions, and a more proper treatment of the disease. It will thus tend to render places habitable by white men, where before they could not subsist.

## NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast; and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## PATENTS RECENTLY ISSUED.

**SMELTING FURNACE.**—Jas. P. McDougal, San Francisco, California. I claim, 1st. A smelting hearth of peculiar construction, A, B, the sloping portion, A, inclining toward C, its lower portion forming the dam-wall or ridge, B, running across the hearth of the furnace from side to side, substantially as described and for the purposes set forth.

2d. The half oval shaped refining hearth, C, conforming in shape to the smelting hearth where they join, the sole of which has a slight inclination from the flue, D, toward B, where it has a lower level than the smelting-hearth, A, for the purposes specified and set forth.

3d. The manner of feeding the fluxes and ores to the furnace by the use of the hoppers, V, V, and grooved bars or rods, W, W, substantially as described.

4th. The devices for feeding the fuel to the furnace and depriving it of its moisture by the use of the cylinder, N, and conducting pipe, c, (or their equivalents,) as herein specified and shown.

5th. The arrangement of the door-hearth, H, H, for discharging the metal and slag, substantially as described.

6th. The manner of binding the said furnace with bands of iron secured to the casing of the furnace and keyed below it, when arranged substantially as described and for the purpose set forth.

7th. The concave rockers, R, R, R, and convex rails, s, s, s, with chimney shield, L, and lever sockets, d, d.

8th. The within described improvements, whether employed singly or in combination in smelting furnaces, substantially as and for the purposes herein specified.

**SEEDING MACHINE.**—Frank A. Hill, Marysville, Cal. I claim the agitators, D, D, in combination with the beveled gearing, B and C, and connecting-rods E, E, substantially described and for the purpose set forth.

**FURNACE FOR DESULPHURIZING ORES.** William Bruckner, San Francisco, Cal. I claim the internal screw ribs or ridges arranged spirally in opposite directions so as to convey the ore alternately from end to end of the cylinder and heat it uniformly.

**GRATE BAR FOR FURNACES.**—Charles C. Bemis, San Francisco, Cal. I claim a furnace grate with bridges or barrier-plates, b, c, d, e, f, placed beneath the said grate at intervals and increasing in depth to near the flue, the whole arranged and constructed substantially as described and for the purpose set forth.

Each of the above patents were obtained through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

## RECENT INVENTIONS.

**NEW USES FOR PEAT.**—Mr. T. G. Ghislin of Hutton Garden, England, has recently invented a process for so treating the universal article of ordinary peat, by chemical and mechanical operations, as to bring it into a state in which it may be manufactured into various useful articles, either of a solid, rigid, or of a flexible character. This process is described in the London Mining Journal, as follows:

He takes any of the common kinds of peat, and having expelled therefrom, either by the application of pressure, heat or otherwise, such of the watery particles as can be easily removed, he mixes with it ground or comminuted seaweed, with the addition, if required, of any suitable gums or gum resins, such as India rubber, gutta percha, or other substances of that class, or in place thereof, or in addition thereto, may be added resins natural or artificial, bituminous substances and products of the same, such as pitch or asphalt, paraffin, stearine, or other oily and fatty matters. To give a body and firmness to the mass, chalk, talc, sulphur, silicious, and other earthy matters may be added. Waste fibrous and woody substances may be incorporated with the other ingredients when it is desired to form sheets, of the material as for floorcloths, and if the surface is intended to be printed metallic oxides, such as white zinc, oxyd of iron, or ochre, alum, and other analogous ingredients may be added. The proportions in which the several ingredients are incorporated with the peat must depend mainly upon the character of the peat and the purpose to which the mass of prepared peat is to be applied when made; for instance, some

peats will be found to contain so much unctuous, fatty or bituminous matter, and some seaweeds so much mucilaginous or gelatinous matter, that the addition of more bituminous or gelatinous matter will be unnecessary. On the other hand, the peat and seaweed may want fiber to give it strength and tenacity; waste fibrous substances, such as cotton, hair, wool, and tow may be incorporated in such cases. In other cases the peat will be found abundant in fiber, but deficient in adhesive substances. Again, for some purpose hardness and rigidity will be required, as for moulding picture frames, or producing articles which are to be ornamented by embossing, such as hook covers. For floorcloths and other coverings or articles for which the mass is to be rolled out into thin inflexible sheets, a larger proportion of fiber will be required than for solid and rigid articles.

(Written for the Mining and Scientific Press.)

**The Use of Iron Sponge for the Reduction of Metallic Sulphides, Phosphides, Antimonides, Etc.**

BY EDWARD PIQUE.

**MESSEURS. EDITORS.**—In several numbers of your valuable paper have appeared items on the above process, and in reading them I have imagined that the operators certainly went a considerably round-about way in this matter. They take first an iron ore, which contains the iron as oxyd, and reduce it to a spongy metallic state. This is one operation which requires labor, fuel, etc. Then they mix this iron sponge with the sulphurets, etc., and put it in the furnace again, which makes the second operation. Here are consequently two operations, each of them requiring labor, fuel, etc., where one operation would have been quite sufficient, and even a great deal better.

The matter is simply this: In the first operation they deprive the oxyd of iron of the oxygen it contains, by treating it with substances which, under the existing circumstances, possess a greater affinity for oxygen than the iron does. These substances are carbon, hydrogen, carburated hydrogen, protoxyd of carbon, and such like. Now, if we consider the sulphur itself to be a combustible substance, equal in its action to the above mentioned, why not mix the oxyd of iron or the iron ore immediately with the sulphurets to be desulphurized, and make one operation instead of two? What does chemistry say about this? There are a great many metals which combine immediately with sulphur, but should the same metals, in the state of oxyds and mixed with sulphur, be submitted to a certain degree of heat, a part of the sulphur will first be employed in combining with the oxygen of the oxyd, forming sulphurous acid, which escapes, and then the remaining sulphur will connect with the metal in the same way as if no oxygen had been present.

This shows quite plainly not only that the reduction of the iron ore to its metallic state is labor and fuel thrown away, but moreover that by employing the ore in its natural condition of oxyd, only about HALF THE QUANTITY would be required to obtain the same result, since the oxygen of the oxyd is itself an agent capable of depriving the sulphur of its sulphur.

The protoxyd of iron consists of one equiv. of iron + one and a half equiv. of oxygen,  $340 \text{ Fe} + 150 \text{ O} = 490 \text{ Fe O } 1\frac{1}{2}$ ; therefore 490 protoxyd of iron contain 150 oxygen, which will convert 150 sulphur into sulphurous acid. The 340 iron will further consume 200 sulphur to form sulphide of iron. The conclusion we arrive at, is that the same quantity of iron ore, which in its oxydized state will combine with 350 parts of sulphur, when deprived of its oxygen will only be able to combine with 200 parts of sulphur; consequently nearly double the quantity of the iron ore will be required when reduced to metal, than when applied in its natural state.

In connection with this matter, I wish to correct an error made by one of your correspondents in your issue of December 22d. Among other sulphides to be desulphurized by iron sponge, he mentions the sulphide of copper, and gives even the precise method of proceeding in the matter. But I am sure the Doctor never tried it, as it is a fixed fact that copper possesses a far greater affinity for sulphur than iron does, and in all the processes of copper extraction, as long as there is any sulphur present, it will certainly remain combined with the copper, notwithstanding any quantity of iron may be present, although the latter will prefer to unite with the oxygen which may be offered to it from different combinations.

## WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,  
January 4, 1887.

## MONEY MARKET.

There has been no material improvement in the demand for money since our last reference, although a fair amount of business paper continues to be offered. For mercantile purposes the demand has been light for some time past, but more activity may be anticipated at an early day. For the development of mining claims in the interior it is thought that large remittances will be required in the spring. A much more vigorous prosecution of the mining interests, both in this State and Nevada is contemplated the present year, and the condition of the money market favors it. The current rates in bank are  $1\frac{1}{2}\%$  per month, and in the open market transactions are made at  $1\frac{1}{2}\%$  et.; in mortgage securities  $1\frac{1}{2}\%$  et. per month is the rate.

The Savings and Loan Society declared a dividend of  $11\frac{1}{2}\%$  et. per annum out of their net earnings during the past six months. In the previous half year they divided  $10\frac{1}{2}\%$  et. per annum. The San Francisco Savings Union have declared a dividend of  $1\frac{1}{2}\%$  et. per month on terms deposits, and  $10\frac{1}{2}\%$  et. per annum on call deposits, out of their net receipts during the last half of 1886; during the first half they disbursed the same dividend.

The Import duties paid at the Custom House in this city, during the year 1886 amounted to \$7,155,913 75; in 1885, \$6,604,413; in 1884, \$6,870,156, and in 1883, \$4,688,339.

## CITY STOCKS.

During the past week Spring Valley Water Co. sold at \$59 @60 50; Pacific Insurance Co. at \$167 @167 50; San Francisco Gas Co., \$84 50; Cal. Steam Navigation 64 63 3/4 et., and Central Railroad (city) at \$40 per share. The twenty-third installment of \$10 on the South San Francisco Homestead Association will be delinquent on the 29th of this month.

The California Home Insurance Co. decided to discontinue their business at the close of 1886, and outstanding accounts are placed in C. J. Farran's hands for settlement.

## MINING SHARE MARKET.

In presenting a brief review of the mining share market for the past year, it may be remarked that at the close of January most stocks had gained considerable strength, though the transactions of the Board for that month had fallen off about \$1,000,000 from the sales in December, 1886. A better feeling manifested itself in February, and from that time until the close of April the volume of business increased, together with a very general rise in prices. The month of May exhibited a decline both in value and aggregate sales, and throughout the months of June, July and August, a marked degree of inactivity and flatness controlled the market, reaching the greatest depression in the last named month. The increased productiveness of the various prominent Comstock claims at the beginning of September again renewed confidence among dealers and July revived the buoyancy noted in the spring; however, prices were not so well maintained during the closing months of the year, with several notable exceptions, as they had been some eight months previously. The very favorable condition of most leading mines for several months past, and the very flattering appearance of the Comstock vein at present depths, gives great assurance of future prosperity. The unproductiveness of deep mining is an exploded idea, and a more united interest is now gaining ground among companies to assist in the speedy inauguration as well as completion of the great work known as the Suto Tunnel.

From a carefully compiled record of the sales in the San Francisco Stock and Exchange Board we give the following very interesting figures, extending over a period of three years:

	1884.	1885.	1886.
January.....	\$ 3,484,284 75	\$ 1,501,598 75	\$ 2,727,187 00
February.....	2,726,420 50	2,358,855 00	3,732,292 00
March.....	2,476,725 00	5,828,900 00	5,289,084 25
April.....	2,649,072 00	4,339,032 00	4,038,096 00
May.....	1,885,283 00	5,663,549 00	3,052,102 00
June.....	2,017,027 00	4,271,640 00	2,406,341 00
July.....	1,907,557 50	4,214,183 00	1,533,874 00
August.....	829,062 75	4,292,618 00	1,284,451 75
September.....	1,285,390 15	4,629,501 00	1,758,190 75
October.....	1,084,612 25	4,000,500 00	1,371,117 00
November.....	1,081,152 25	2,018,906 00	2,533,475 50
December.....	2,372,468 25	3,777,437 00	3,635,678 25
Totals.....	\$25,832,715 00	\$40,205,819 75	\$32,835,899 50

making the total sales of the three years \$107,874,428 25.

Hale & Norcross exhibited the most regular and rapid progression during the past year of any stock on the list, opening in January at \$240, improving to \$1,000 in March, receding to \$950 in April, then gradually advancing to \$1,500 in October, since which time no sales have publicly transpired. At the close it is firmly held, with bids at \$2,500. The monthly bullion returns of this company have increased from \$31,546 03 in February, 1886, to \$167,034 89 in November, giving a total for those ten months of \$1,055,419 87. This sum was produced from 22,626 tons of ore, showing an average yield of \$46 65. Ten dividends have been disbursed to shareholders out of their net earnings during the year under review, amounting in the aggregate to \$350,000. In the month of December, besides the regular dividend of \$100, an extra one of \$200 was declared, making a total distribution of \$120,000 in that month.

Savage met with marked appreciation since July last, and from that period extensive deposits of ore have been disclosed in their lower levels. In January this stock sold at \$700, steadily advanced to \$1,100 in April, receded to \$865 in July, and then rapidly improved to \$2,050 in December, closing at \$2,200 asked. The aggregate yield of bullion for the fiscal year, closing with July, 1886, was \$1,363,852 91, from 29,535 tons of ore, or an average of \$46 14 per ton. During the five months ending with November last the yield has been \$896,561 59, from 19,334 tons of ore, or an average of nearly \$45 per ton. Taking half the product of the last fiscal year, say \$650,000, as belonging to the yield of 1886, and we have a total of \$1,549,561. From July to the close of the year \$360,000 have been paid to stockholders in dividends. We learn from the mine that during the week ending December 29th, splendid ore had been found in the southeast drift on the seventh station, eighty feet southeast from Winze No. 2, while working towards the Curtis shaft.

Yellow Jacket exhibits a fluctuating record for the past year, selling at \$440 in January, \$505 in April, down to \$350 in July, then at \$370 in September, receding to \$600 the next month; in December met with a rapid advance to \$1,410, and closing yesterday at \$1,315. The amount of bullion produced by this company during the past year has been about \$2,300,000—the largest monthly yield was \$379,706, in August, and the lowest in February, \$39,550—and from this sum \$390,000 were distributed to stockholders in dividends. One assessment of \$160,000—\$150 per lot—was levied in February, 1886. From the 1st to the 24th of December \$116,712 73 have been accounted for in bullion, and that month will probably show a yield of \$160,000. The news from this claim is very favorable, and it is said that the south mine is in

proving daily. No change is reported in the north mine, and during the rainy and inclement weather of the past month neither mill nor mine sustained any damage.

Crown Point increased in market value from \$565 in January to \$1,300 in the month of April, sold at \$950 in May, and \$1,650 in June, dropped to \$700 in July—during which month the bullion returns were meagre and amounted to only about \$37,500—rallied to \$825 in August, receded to \$880 in September, and from that time improved to \$1,200 in December, and during the past week sold at \$1,300. The heaviest receipts of bullion during the twelve months of 1886 were in February, amounting to \$155,461 63, and the lowest in July, as above stated. For the year the yield has been \$1,273,563, from say 33,377 tons of ore; previously the mine produced \$217,748 14, making a total of \$1,491,251 14. During the past year this company declared six dividends, \$50 per foot in March, \$80 in April, May and June respectively, and \$50 in November, and the same amount in December, aggregating \$234,000.

Gould & Curry sold at \$885 in January, reached the highest point during the year in February—\$1,060—steadily declined to \$450 in November, advanced to \$775, and brought \$625 @620 during the past week. During the fiscal year ending November 30th, 1886, the bullion product of this company amounted to \$1,635,333 92, being the yield of 33,163 tons of ore. March produced the most of this sum, \$174,066 46, and July the least, \$105,446 49. The bullion received in December was \$103,427 14. This lessened yield is due to the necessary general repairs required at the mill, obliging them to run at half capacity during the greater part of the month. The ore product of that month was about 2,350 tons, of which 1,550 tons were delivered to the Gould & Curry mill and 700 tons to custom mills. Three dividends were paid in 1886—in January \$50 per foot, in April \$30, and in June \$80—making an aggregate disbursement of \$252,000 to stockholders.

Chollar-Potosi improved from \$139 to \$300, receded during the succeeding seven months to \$102, and in December sold at \$245, closing yesterday at \$219. In the year just closed this company received about \$350,000 in bullion, from say 47,800 tons of ore. A large amount of this ore was of a low grade and was sold at the mine at an average of about \$3 per ton.

Empire opened in January at \$250, sold in March at \$250, then declined to \$75 in September, and from that period advanced to \$207 in December, selling during the past week at \$200. From a very full statement furnished us in regard to this mine, we condense the following: Bullion product of 1886, \$486,771 78; dividends disbursed to stockholders, \$32,400; and the amount of ore reduced was 19,750 tons.

Imperial advanced from \$113 in January to \$177 in March, gradually receded to \$94 in August, then improved to \$145 in December, selling at \$130 during the past week. This company shows a bullion yield of about \$99,150 in 1886 from 33,322 tons of ore. During the same year dividends to the amount of \$176,000 were paid to shareholders.

Ophir rose from \$345 in January to \$750 in March, then rapidly receded to \$83 in November, rallied to \$235 in December, selling at the close at \$155. During the fiscal year closing with November last \$483,324 69 were received in bullion from 11,163 tons of ore, showing an average yield of about \$40 per ton. In October of 1886 an assessment of \$72 per foot was levied, and in December one of \$60.

Alpha rose from \$200 in January to \$370 in February, fell to \$271 in March, advanced to \$450 in the following month, then receded to \$95 in August, since which time it has been out of the market, until the close of December, when a few shares were disposed of at \$150; yesterday it sold at \$200. During 1886 three assessments were levied, amounting in all to \$144,500.

Belcher sold in January at \$145, advanced to \$377 in April, then declined from month to month to \$62 in November, rallying to \$145 in December, and selling during the past week at \$130 @132. Three assessments were asked of the stockholders during the year under review—\$60 in March, \$45 in July, and \$30 in October; total, \$145,520.

Overman fluctuated very materially during the past year, selling at \$41 in January, \$95 in March, then at \$37 in June, and \$50 in July, receding to \$17 in December, and at the close brought \$17. This mine produced \$7,953 from February to September, 1886. Six assessments throughout the year required from the stockholders \$208,000, of which sum only \$152,346 has been collected to this date.

Bullion opened at \$33 in January, advanced to \$117 in April, gradually receded to \$10 in October, rallying to \$16 in December, and at the close of that month improving to \$30 @35, assessment of \$10 delinquent, and closing yesterday at \$30. Seven assessments of \$10 each were levied during 1886 amounting to \$175,000.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last amounted to \$59,349 75.

**"NEVADA AND COLORADO."**—The Reese River Reveille has an article under the above caption, in which it institutes a comparison between the Smith & Parmelee mine—which the "Journal boasts of as having produced in one month, with seventy-eight stamps, bullion valued at \$33,500, in currency—and the Great Eastern, at Austin, which has been ridiculed as a "shoe-sting" mine. In the month of November, this mine yielded bullion valued at upwards of \$50,000 in currency, employing twelve stamps for twelve days. Taking into account the difference in the cost of mining and reducing—said cost being about fifteen dollars per ton in Colorado, and fifty dollars in Austin—the profit on the Smith & Parmelee was only \$12,000 per month, while on the Great Eastern it was over \$29,000.

The new fire-alarm hammer is much more efficient than the old one. The stroke of the bell can now be heard in every part of this city.

R. H. STRETCH, State Mineralogist of Nevada, has been appointed by Gov. Blaisdell, Commissioner from that State to the Paris Exposition.

GOLD IN CANADA.—The Madoc gold mine, near Belleville, in Canada, was discovered a few months since, in the following manner: A man by the name of Richardson, having been told that there were indications of copper on his land, that metal having been found in the neighborhood, commenced to prospect for it. After blasting away for some two months, he came upon a large deposit of brownish earth, filling a sort of pocket in the rock. Some two or three cart loads of this had already been removed and thrown away, when an old gold miner, passing by chance, took a pan of it to a neighboring stream, and obtained nearly an ounce of gold. The experiment was repeated, with a yield of three ounces. The news spread abroad, and a Boston man, named Carr, offered to pay Richardson \$20,000 for the mine before the 10th of December next, which offer was accepted. Before he left, a building was erected over the shaft, fastened by two pad-locks, the keys of which were pocketed by Richardson and Carr respectively. Neither can enter until Carr returns. Should he not do so, Richardson will work the mine himself. This has a singular look to us Californians. The story should be taken, perhaps, *cum grano salis*.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County—

From the Miner of Dec. 29th: The Mow-er boys are finding very hard rock, averaging from four to six inches to the shift. . . . The Schenctady Company's first letting of 300 feet of tunnel on the old Tarshish property, is completed, and the contractor, Mr. Wilson, having received instructions to continue on until a vein is opened, will keep pushing the work vigorously ahead.

The question whether the Washington mill will produce bullion from Morning Star ore is settled. Although the first brick could not be got ready for Christmas, they are saving up the amalgam for a New Year's report.

The contractor on the James Barrett tunnel, after the first run of twelve feet, has been encountering very hard working rock. Yesterday the workmen thought they saw a change for the better.

From the Silver Mountain Bulletin of Dec. 22d: The Washington mill has been crushing all the week, and we are informed that the machinery works smoothly. . . . The Del Monte are making arrangements to sink a hundred feet. It will probably take them about three weeks.

From same of 29th: The yield from five thousand pounds of Morning Star ore is estimated by good judges to be not less than 1,200 pounds of amalgam. It was not melted at our going to press.

At the delinquent sale of Mountain stock, only twenty-five shares were sold, the remainder being all paid in. The tunnel is being driven day and night, and is now in over one thousand feet; and, unless the estimated distance to be run is very wide of the mark, they must be within two hundred feet of the monster lode. The prospects of the Mountain are brighter to-day than at any former period.

## Amador County—

From the Ledger of December 29th: Mr. Fenton and others have taken the Spanish claim, and will commence operations on it next Monday. They intend to push work on it night and day until the mine is fully developed. This claim is situated on the same range with the Coney & Bigelow mine, and immediately south of, and adjoining the Austrian.

A lucky fellow, who wishes us not to mention his name, picked up a nugget not far from Clinton, the other day, that weighed over thirteen ounces.

The late heavy rains seem to have inspired our placer miners with new life and hope. From all parts of the country we hear of more prospecting and "good strikes" than for years before.

Tubb's mill was started on the 17th of December, and worked well.

## Calaveras County—

The Courier has the following: "It has been many long years since our miners were in better heart than in the present year. Capitalists are beginning to appreciate their lodes at something like their true value in consonance with their own estimate of their worth; hence, there never was a fairer show to get outside help for their development than at the present time. We have conversed with several old miners who have been stumping the far-off regions of Montana and Idaho, and they all say the chances are a hundred fold better here at home.

## Colusa County—

The Marysville Californian of the 27th of December, says: We saw yesterday a fine specimen of copper which had been put through the smelting works of the Lyon Company, which is situated about three miles from Ashton. Out of seven hundred pounds of ore which was put through the process, five hundred pounds of pure copper was obtained.

The Marcuse oil well was recently visited by the editor of the Clear Lake Sentinel, who gives the following particulars: "This well is situated in the foot-hills of the coast range, about eighteen miles west of Colusa. The company have an eight horse-power engine to persuade the drill to penetrate the hard rock, with which they are constantly operating—working night and day in search of that which will throw so much light on the world. At the depth of thirty-eight feet the first indication was perceived. Two fissures have subsequently been penetrated, but as yet no experiment has been made with the pump. It is the intention of the company, we believe, to insert the pump when they arrive at the depth of 600 feet. This company has expended about ten thousand dollars on their well already, and

are determined to sink down 1,200 feet should they fail to find a sufficient supply when they try the pump."

## El Dorado County—

A Placerville letter to the Alta, dated Dec. 27, says: Our quartz interests are still on the upward swell, prospecting lively, and the results gratifying all around. There is no let up to the rich prospects obtained from the Decomposed Lode, and when we get down to the hundreds in depth something wonderful may be expected. The Poverty Point lodes are improving daily. The Perseverance mine is being worked by Sam. Ten Eyck. He has reached a depth of seventy-five feet, at which point the ledge is over five feet wide; and he is taking out plenty of fifteen dollar rock, and intends going down two hundred feet before drifting.

On Grizzly Flat, at the old Eagle mine, they have taken out rock that will average sixty dollars per ton. The Stooly, a continuation of the same ledge, has lately been purchased for a large amount, by a Sacramento company, and a mill will be erected at once. All this is very encouraging, but the Sierra Nevada, formerly the Knox, has led the van. It is owned by a Boston company, is 3,500 feet in extent, and has now a shaft 114 feet deep on a ledge six and a half feet wide, of an excellent quality of rock. The company have now in process of erection, a forty stamp mill, hoisting works, etc. The mill will be running in about twenty days; the hoisting works are complete, and now in operation. All through the southern portion of El Dorado the utmost activity prevails; yet there are plenty of rich mines for capital to develop that are now idle for the want of it.

A despatch from same place, Dec. 26th, says: The Woodside quartz mine, at Georgetown, still yields quantities of gold. The decomposed quartz lode near this city is growing richer daily, and shafts are being sunk for three miles along the vein, and all prospect rich.

Some of the most valuable blue gravel claims in the State are now being opened, on one of which a fine mill has already been erected, and it will soon commence crushing cement, which prospects very rich.

## Mariposa County—

From the Gazette of Dec. 29th: McKee and Flannigan's mine, situated about a mile to the east of Greeley's sawmill, exhibits brilliant prospects and promises a rich fortune to its lucky owners. They have taken out three tons of rock which is expected to yield from \$10,000 to \$15,000 per ton, besides a large quantity that will pay at the least calculation from \$30 to \$50 a ton. The proprietors are maturing their preparations to erect at once a 10-stamp mill, for crushing purposes, and if the prospects warrant it they will add ten stamps more. The vein is five feet in thickness, and is described to us by an eye witness as very rich in appearance.

During the storm of last week, the water was five feet deep in Hite & Co.'s quartz mill. Considerable damage has been sustained by the overflow of the river on both sides, of which we shall hear more particulars. River mining is suspended for the season.

## Nevada County—

From the Gazette of Dec. 28th: On Wednesday last, E. K. Holmes picked up a quartz specimen on a pile of tailings near the mouth of Wood's Ravine, containing two ounces of gold.

From the Grass Valley National of Dec. 26th: On Monday last, Z. Denman picked up, on the old Day diggings, a specimen which weighs thirty-seven ounces, and is nearly solid gold. He was offered \$660 for it.

From same of 27th: The Empire mill, on Ophir Hill, started up again yesterday. The mill has been shut down for the past ten days on account of the large quantity of water in the mine. The mine has now been pumped dry and arrangements have been made that will prevent a recurrence of this thing. An improvement is being made in the way of putting in blankets. The mine is looking remarkably well just now.

The sulphurets works at the Eureka mine are now completed, and they are only waiting for the arrival of Mr. Deetkin, the gentleman who is to have them in charge.

From the Grass Valley Union of Dec. 22d: The New York Hill Company now has about four hundred and fifty loads of quartz lying above ground, and the Rocky Bar mill commences crushing to-day. The rock looks as well as any yet taken from the mine, which is compliment enough for it. The new pump is now working to good advantage.

The Amador Ledger says: William H. Hooper, now mining in Grass Valley, Nevada county, informs us that one day last week he pounded out in a hand mortar, five

thousand, five hundred and thirty dollars. Such rock as that is (not) hard to beat.

EXCELSIOR.—From the Meadow Lake Sun of Dec. 22d: The machinery for the Reduction Works has at length arrived, and the mill will be in readiness to commence operations with the New Year.

We are pleased to learn that the Eagle Company have received their new machinery, and it is hoped, ere another week passes, that the mill will be in complete running order. They are pushing the work on their ledge with zeal, and are taking out large quantities of good pay rock.

A gentleman writing from Carlisle, a mining camp near Meadow Lake, informs the Transcript that the town is quite lively, and the U. S. Grant mine is being worked night and day, turning out first rate rock. The mill will be kept in operation all winter.

## Placer County—

From the Herald of December 29th: Columbia's Pride is the name of a new quartz ledge recently located by Neal McDevitt and others, about a mile west of Ophir, near Hathaway's ranch, on Auburn Ravine. The rock is rich in fine gold, and easily crushed. The company are now getting out a number of tons of rock, which they intend to have crushed at the Golden Rule mill at Stewart's Flat.

Gradually our valuable quartz mines are working their way into notice, and men of means are beginning to realize the fact that "Auburn District" contains some very rich quartz mines. The recent rich yields from the Mallett, Wells, and other veins, demonstrates this fact beyond a doubt. Numerous ledges are now being worked, and in the course of a few months, from what we have seen of the rock, will, by mill process, prove rich.

From the Dutch Flat Enquirer of December 29th: We understand that the Yuba company's ditch is now all right, having been obstructed but a few days by a tree falling across and breaking the flume just below Alta. Mr. Holmes, the superintendent, soon had workmen on the ground, and but a day or two elapsed before the accident was thoroughly remedied, and the waters of the Yuba now boom with their accustomed velocity to the glad miners of Gold Run.

## Plumas County—

A letter from Mineral Township to the Plumas National of December 22d, says: Mining items at present around this portion of Plumas are not very plentiful. The miners have not had enough water to sluice with advantage, and drift diggings directly around this neighborhood will not pay over five dollars per day to the hand. Scotty and Garrett, at New Boston, are doing pretty well, and so are Hamp, Brown & Bro. Squire Jacks is likewise on hand with his little wages—five dollars per day. Squire Metcalf has commenced matters in earnest, and we expect soon to hear of Ed.'s taking out big pay. Jackson, Akers & Co. are getting a good ready to sluice off a few acres of Grub Flat gravel.

## San Bernardino County—

P. Beandry's Slato Range Quartz mill was recently burned by Indians. Twelve houses connected with it were burned also. Loss, \$50,000.

## Shasta County—

From the Courier of December 22d: The work continues to progress on the Red Warrior claim, notwithstanding the bad state of the weather. At last accounts a lode of very rich silver rock had been struck.

Both the Mammoth and Potosi mills have stopped running for the present—the former on account of the difficulty of hauling rock over the soft roads. The water comes into the Potosi shaft so rapidly that the pump has to be kept running constantly to keep it dry.

## Sierra County—

From the Messenger of December 22d: "Alturas" informs us that at Council Hill and other places on the south ranges of the county, some of the miners had commenced piping a week or so ago, and that it was then raining at La Porte.

The Pittsburg Gold Mining Company, of Potosi, was incorporated Dec. 15th. Capital stock \$96,000.

From the same of Dec. 29th: We have recently seen a specimen of rock from the Vienna ledge which was full of fine gold. The ledge is being developed. . . . The storm at Howland Flat caused some damage by carrying away a few flumes and washing some dirt in dumps not well protected.

The following items are from Port Wine: A. Pedanet & Company's stock dirt washed away, to the amount of about \$1,500 or \$2,000.

The Canny Company's ditch and flume on Bunker Hill is broken down.

The Eagle Company's main tunnel caved in, catching several men inside, who barely escaped by crawling out on all fours.

The Monte Cristo Company lost their tailings and stock dirt.

The Golden Gato Company sustained a loss in timber; shed and much of tunnel filling up with tailings from Monte Cristo Company's flume breaking down, and a tree falling over track, reservoir and dump house.

Alleghany items: The Fac Simile mine is standing for the present. The Union mine is still following the vein with good prospects. The Twenty-One has sunk on the vein to the depth of eighty feet, the vein increasing in width, and sulphurets more abundant. They are rigging up a new pump. The Oak Flat mill is about to be started on some very rich rock. The Greenback mill has made a run of one week, but I could not find out the result. The Masonic and Highland companies are not working as many hands as they did a few weeks ago, owing to some very hard rock. Smith's Flat is still contributing a small share of ore.

From Chip's Flat: The Yankee Company, at Balsam, have out 2,500 loads of pay and were about to wash it out.

The Mammoth Branch were working three shifts and getting along rapidly.

The Morning Star expects to be in pay very soon.

Both Newell's and the Oak Flat mill were crushing.

Some rock from the Spoon ledge, that he saw last week, was richer than ever.

The Twenty-One have gone down with a shaft about seventy feet, the rock increasing in quality and quantity.

The diggings at the Minnesota are also paying well.

It seems to be the general opinion that the work last season on most of the Bear Valley ledges was so injudiciously done that it will be better to commence anew in the spring rather than to take advantage of what has been done.

## Yuba County—

From the North Californian of Dec. 27: The Blue Point Gravel Mining Company, at Smartsville, have engaged Mr. Stevenson, a man experienced in the use of nitro-glycerine, to introduce the oil and test its value for blasting purposes. The tests will be made in the company's bed-rock tunnel and in blowing up of the hills and cement banks. Between 5,000 and 6,000 kegs of powder are now used annually at this place for blasting. If the oil will do one-half the work claimed for it by its advocates, farewell to powder. It is intended that these tests shall be public, and all practical miners and others are solicited to be present. Every facility will be given those interested to make themselves thoroughly acquainted with the material, the mode of handling and working with it.

A dispatch from the same place, Dec. 29: The Pennsylvania mine, at Brown's Valley, has a fine prospect ahead. The company is now down on the ledge one hundred and sixty feet, at which depth it is from twelve to fifteen feet wide, and pays from \$20 to \$45 per ton.

The Appeal of January 1st, says: The new battery of the Pennsylvania mill, at Brown's Valley, will be started this morning. Other parts of the new mill have been in operation for several days, but the sixteen stamps will be set in motion this morning for the first time, with a capital of 100 tons of rock within the reach of the feeder, taken from over five hundred feet below the surface.

We learn that the Andrew Jackson Company will start up their new mill in a few days.

Camptonville items crowded out last week: Hon. B. P. Hogg is just finishing his tunnel, and is ready to open the Union claim with good prospects. The claims at Young's Hill, Galena Hill and Oak Valley are paying very well. The quartz claims in this section are looking up. One-fourth of the Fiddletown ledge, at Pike City, was sold the other day for one thousand dollars. The copper claim of McKean, Newbery & Co., looks well, with strong indications of a very large ledge.

The Babb Company, near Timbuctoo, has struck into the old river bed, and fine gold can be seen in the gravel. . . . The Peterson Company have completed their upper tunnel cut and flumes, at a cost of \$12,000. . . . The Pittsburg & Yuba River Company are starting with a bank of thirty feet. Eight or ten feet of the bottom is Old River dirt, some of which is very rich.

## NEVADA.

## Esmeralda—

The Union of Dec. 22d, in an article on the mines of Nevada, summing up the progress of the year, says: In Bodie District the ore is easily mined and easily worked. The Empire Company's claims are in the most forward state of development. The next in order is the San Antonio mine ad-

joining upon which has been sunk a shaft to the depth of one hundred feet upon the ledge, at which point a body of pay ore has been discovered some five feet in thickness. The Crescent location next adjoining is one of the most valuable in the district, upon which a shaft has been sunk to the depth of one hundred and seventy feet where a fine ledge of gold bearing quartz has been developed.

#### Hubbaldt—

From the Register, Dec. 22d: Several old settlers, who have during almost all the past three years been interested in the claim, have re-located the old Westerfield ledge, and are now sinking a working shaft, intending to keep on until they bring the mine up. The ledge is 7 feet wide, and assays rich in silver—with copper and some gold.

The Essex has been followed by drift for some distance in two directions from the point at which it was struck. It maintains its width and richness, and may be accounted a proved and reliable mine.

Work on the North Star progresses finely. The tunnel is described to us as a beautiful work, high and straight; and yet it was pushed 54 feet in 9 days. Four men are running the tunnel, while four others are sinking a shaft on the ledge.

The Reveille ledge has been conveyed to the Knickerbocker Company, organized in the State of Maine.

We have seen a splendid specimen of quartz from the Gem. It weighs probably 70 pounds, and is corded in every direction with rich chlorides. The ledge has been followed about 70 feet from the point of striking, and continues of a substantial character, carrying about 18 inches of this rich rock. Fall is working a lot of ore from the Gem at the Pioneer mill.

#### Reese River—

From the Reveille of Dec. 19th: Eight tons of ore from the Chase ledge, in New York Canon, was reduced at the Metacom mill. A bar of silver valued at \$1,603 was the result.

From same of 21st: In Danville District, the Vanderbilt has been opened to the depth of 20 feet, and shows greatly improved ore. At Hot Creek work progresses slowly. In Isveille District new discoveries are almost daily made, and the ore is identical in all, with two exceptions, the "Fisherman" and one other. These show a very rich ore of a deep blue color.

The mill of the Consolidated Company at Hot Creek was to commence running on the 1st of January. Charles Coorn has purchased the Shenandoah, and is running a cut 20 feet deep through the ledge.

Same of 22d: The new Metacom mill performs beautifully. The battery is pronounced to be perfect. Owing to the difficulty of obtaining the proper quality of lumber for the construction of barrels, the amalgamating room is furnished with but three instead of six barrels, and the mill will be temporarily stopped to make up the required complement. The ore that has been reduced from the Metacom ledge has yielded \$135 per ton.

Col. Buel yesterday brought in \$9,000 from his mill at Silver Bend. The yield per month of his 10-stamp mill is nearly \$20,000. The Highbridge mine is looking better than ever.

Same of 24th: The little Timoke mine—the silver "shoe-string" of Lander Hill—will make a handsome Christmas present to its eastern stockholders. W. F. Leon, its Superintendent, will transfer to-day, by telegraph, the sum of \$9,500, the result of five weeks' run—equivalent to five per cent. for thirty-five days on the capital stock of the company.

Same of 26th: The locations in Northumberland District have been much improved of late by a little work. We will mention particularly the Central, Alta, Viola, Independence, and Ten Thousand a Year, all of which show good ledges and excellent mineral at the depth of a few feet below the surface. The Central has an incline shaft of 8 feet in depth, showing fifty dollar ore. The Viola has a 4 foot cut. The Alta has a vertical shaft of 12 feet showing a 2½ foot vein. The Independence has a 4 foot vein. Ten Thousand a Year has an incline 7 feet in depth, with a vein of 8 inches. The ore has assayed \$960.

#### Washoe—

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Territorial Enterprise, Dec. 20th: The pumping arrangements at the Bonner shaft of the Gould & Curry mine have caused the water to recede in the shaft until the mud and sediment in the bottom is nearly reached. It will take some little time yet before that is got out, when the sinking of the big shaft will be resumed. Large amounts of a very rich character of ore, in which native silver can be seen in

abundance, are being taken from the lower levels of the Yellow Jacket mine at Gold Hill.

From same of 23d: Dall's mill in Washoe was totally destroyed by fire on the evening of Dec. 21st. A new water wheel had just been completed at a cost of \$15,000. This mill was insured by the Pacific Insurance Company for \$25,000. Several miners have taken a contract to run an incline to the depth of 125 feet on the Plato mine, at Gold Hill. They receive for the work \$7.50 per foot, the mine furnishing the timbers. . . . The Petaluma mill, in Lower Gold Hill, is fast approaching completion, and will be in running order within two weeks. The motive power consists of a 29-horse power engine, which will drive sixteen 700-pound stamps and six Wheeler pans.

Same of 28th: The great amount of water recently struck in the new shaft of the Sierra Nevada mine proves too much to contend with, by means of the bailing apparatus, therefore the large pump of the company formerly used is now being placed in the new shaft.

Same of 29th: The Yellow Jacket Company intend sinking the south shaft of their famous mine one hundred feet deeper. A new reel has been placed in position and other machinery prepared for the purpose, and the work of sinking will soon be commenced.

From the Virginia Union of Dec. 21st: Several rich lodes in the vicinity of Crystal Peak have caused some excitement, but the only one that has been prospected to any desirable results is the Truckee Ophir. Several tons of ore, worked at Dall's mill, near Franktown, gave a return of thirty dollars in silver and gold to the ton. The ledge is large, finely developed, with clay casings. The company will in the early spring erect a mill.

From same of 22d: The Gold Hill mill shut down on Saturday night to overhaul their boiler and make some repairs to other machinery about the mill. The company have a large amount of rock on hand at the mill.

Same of 24th: We understand that suit is about to be commenced against the Savage Company by San Francisco parties holding a controlling interest in the Bajazet & Grass Valley stock. As it will involve the title of the Savage to the vein, they are now working to the east, and which is the northern extension of the rich deposit being mined by the Hale & Norcross, this will be the most formidable controversy into which any of the Comstock companies have been forced since the days of '63.

The Gold Hill News of 27th, says: The new carpenter shop of the Savage Company, and the new building over their dump-house is about completed. The mine is now in a condition to produce a great deal more ore than can be taken away. The present muddy condition of the roads proves a great drawback to our mining interests.

#### ARIZONA.

A letter dated Prescott, December 16th, has the following: Major Coffin, of the Bully Bueno mine, is taking out very rich rock. Judge Flower has cleaned up remarkably well at the Sterling mills. Ore yields from \$80 to \$100 per ton, and no mistake. The gold is in town, and speaks for itself. From thirteen tons he secured seven pounds of gold. Woolsey's last run at the Agua Fria mill paid \$35 per ton. The ore was from the Ticonderoga lode. Tyson & Coulter now have their mill in good order, and by running through their new pan some 1,100 pounds of tailings they got \$139.

#### BRITISH COLUMBIA.

From the Victoria Colonist of Dec. 11th: Several members of the Gold Hill Company on French Creek, arrived here last evening. This company has run a tunnel 130 feet into the hill, and have taken out a large amount of gold in pieces of from \$38 downwards. They left part of the company wintering in the tunnel, and had everything in a state of readiness for hydraulic mining the whole of the bank next season. The tunnel is known as the Blue Nose Tunnel.

About fifty persons will winter on the creek. On McCulloch's creek there were very few persons, and only one company working. Only about sixteen persons will winter at Seymour.

Shep Bailey sent word to his partners to come down at once to Kootenay, as he had struck new diggings higher up that river much richer than anything ever found on French creek.

Some picked ore from the Stuart Ledge, Hixon Creek, Cariboo, assayed at the rate of \$6,000 per ton. Gold is visible in every piece of a lot of 1,200 pounds brought down recently.

#### COLORADO.

From the Journal of Dec. 11th: Deacon Baxter has at length reached pay on the "Baxter and Crispian lode," situated on

Spring Gulch. At a depth of 114 feet he has uncovered a fine crevice of pay ore, eighteen inches in width. . . . The "School claim" on the Notaway lode was sold last week to the Notaway Company for one thousand dollars cash. . . . The Empire mill is now running on ore from the Smith & Parmelee mine. . . . The Empire State, Texas and Tinder Gold Mining Company have commenced operations on the Kansas lode, Nevada district, and at a depth of forty-two feet have developed a three-foot crevice of very fine looking ore.

The Black Hawk Mining Company is now running forty stamps on ore from No. 1 Gregory. The mill located at Gregory Point is kept steadily at work crushing ore from No. 2 Gregory, with satisfactory results. . . . The Corydon Company have been mining steadily for the last six weeks on the Corydon lode, and have a fine crevice of iron at a depth of about 220 feet. The company are working six hands, and have been getting out about six cords per week.

The old Wright mill is being repaired for work on Gunnell ore for Mr. Fitzpatrick. The Quartz Hill tunnel is now in 170 feet.

Assays of ore from the Herkimer lode, near Georgetown, Clear Creek county, show \$1,185 to the ton. . . . John Hite is working the Sapphire lode near the Gunnell, with good prospects.

On James Creek, Cobb & Clough have struck a good lode with pay at the depth of twelve feet. They are now down twenty-six feet, and have a crevice of eight feet. The Stanley Company are doing well.

The Bay State Company, formed in Worcester, Mass., broke ground for the mill on Sept. 1st, in Nevada Gulch. The mill is now complete. It has a vibrating engine of 25-horse power, a Dodge crusher, a Swansea desulphurizer, and a barrel for amalgamating, into which steam is introduced through the hollow shaft, which is perforated with holes for the purpose.

#### IDAHO.

From the Avalanche of Dec. 15th: Messrs. Jackson & Burnham have been experimenting on the Vulean ore. By assorting the rock and working the decomposed and solid portions separately, paying results have been obtained. The ore can be mined and milled at an expense not to exceed \$20 per ton. The progress made by recent experiments in saving the gold and silver shows that the Vulean ledge is rich enough to pay a large profit.

The Shoebar mill starts up Monday next on one hundred tons of Vulean ore, and will probably make a test of the Dashaway ledge also.

Fred Warnke and others interested in the Discovery ground of the Sherman ledge, Flint District, are running a tunnel in from the gulch below to strike the ledge. The formation is such that a seventy-foot tunnel will tap the ledge at an equal depth. No work has been done in the Discovery hole since last September, where the ledge shows a prospective width of over eight feet, and a silver bearing indication that is highly satisfactory.

An Iowa company are intending to prospect the Forrest ledge, by means of a 300-foot tunnel. The two mills in Flint District will be ready for use early next month. Roasting furnaces are being erected.

From what we learn, the conduct of the men employed in the Cosmos mine was very reprehensible. Those employed in the mill took the report of the attachment with coolness. The men were paid, and the suit dismissed at once. There is no news here that the company in New York have dishonored a draft, or think of doing so.

From Silver City, Dec. 23d: The Reynolds Creek Coal Company near here, who have a tunnel in the hill over 200 feet, are confident from present appearances of finding coal in paying quantities.

#### MONTANA.

A letter to the Alpine Chronicle, under date Nov. 15th, says: "The mines, so far as I have seen, are different from those in California, being confined to what they call 'gulches' in California they would call them 'ravines,' and as a general thing, there is very little water in them, and not far enough to work them to advantage. Wages are low this fall. I know of men working for \$40 per month, and hear of others working for one dollar a day, to lay in a little grub for winter. About half the emigration from the States took the back track, and went down the Missouri river this fall; and before spring about half of the other half will wish they had done the same thing."

From the Herald of Dec. 6th: G. B. Thomas arrived in town on Monday last, direct from the copper regions on the Muscleshell. Thomas brought with him some 1,500 pounds of ore, from the results of the assay of which a correct estimate can be had of the value of the mines. We are persuaded that we do not overrate the Muscleshell ores

one whit when we say they are among the richest ever dug from the bowels of the earth in any country.

We are informed that a new dry gulch discovery has been made in the vicinity of Lost Horse, which promises to be among the best discoveries made in this section of the Territory this season. The surface of the pay dirt is reached at a depth of thirty feet, and prospects sixty cents to the pan.

We ascertain that several gold discoveries have recently been made between Indian and Beaver creeks, distant from this place about thirty miles. The new diggings comprise five dry gulches, the prospects from each of which are reported rich. A great number of claims have already been taken. The diggings are said to be unusually shallow, and so rich that, with the necessary water, miners will realize their \$50 a day, without any unusual exertion.

#### OREGON.

The Dallas Mountaineer says fine specimens of gold and copper bearing quartz have been found on Eagle creek. The city is rapidly filling up with people, the recent unoccupied houses are all filled.

A correspondent at Ellensburg writes to the Jacksonville Sentinel: Do you know that in this neighborhood there are good diggings that pay \$50 per day to the hand? At Randolph, at the mouth of the Coquille river, they have discovered the old ocean beach, some three hundred feet above the beach of the present day, and about three miles inland. At Randolph, the beach diggings of early days were very rich—\$1,000 per day being made—no doubt fed by this older beach now found. It is most likely that the "streak" at Randolph is much older than the one at "Gold Beach," as the latter is only about 80 feet above the present beach, and the sand is not so plentiful nor so rich. We look for rich discoveries next summer. In prospecting for that "streak" at Randolph, they intend boring, as it is covered with 30 feet of earth and thickly set with timber. A creek cut through and exposed it.

### Professional Cards.

#### SHERMAN DAY,

#### Mining Engineer,

No. 57 Montgomery Block, San Francisco. Will examine, survey and report upon mines, and advise concerning investments in mining property, or the machinery management and expenditures of mines.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. San Francisco, Jan. 11th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

## San Francisco:

Saturday Morning, Jan. 5, 1867.

## NOTICES TO CORRESPONDENTS.

"J. D."—AMBER, so extensively employed as mouth-pieces for meerscham pipes and cigar-holders, is believed to be a fossilized vegetable gum or resin. Anciently a fabulous origin was attributed to it. As it was found on the sea-shore after a storm, it was said to be the solidified tears of the sisters of Phæton, or of sea nymphs. It is of a yellowish color, frequently streaked with milky white, the yellow color being semi-transparent. Those specimens which have a clouded milky appearance are the most highly valued, as the clear yellow can be imitated by recent and cheaper gums. It is singularly electrical when rubbed, developing negative electricity to such a degree in manufacturing it into the forms in which it is sold, that the workmen are sometimes affected with nervous tremors, and they are obliged frequently to change the pieces they handle.

It is found on the Baltic coast of Prussia, either washed ashore after a gale, or entangled in masses of seaweed. Mines of it are also wrought in Prussia. It is found in this country at Amboy, N. J.; at Gayhead, Martha's Vineyard; and at Cape Sable, in Maryland. Leaves of fossil plants and tropical insects are sometimes found imbedded in it, a fact that has given rise to some pretty poetical conceits, as an instance of which we may mention the comparison made by that celebrated and witty divine, the Reverend Sydney Smith, in regard to the English statesman Canning, viz., that "his position was like that of a fly in amber," the insect itself being an unimportant fact, the wonder consisting in how the deuce it got there. In the East it is highly valued, and has been used as a form of concentrated wealth, as are diamonds and other precious stones. When heated, it exhales an agreeable odor, and for this, among other reasons, is in great request as mouth-pieces for pipes.

"NEW GRENADA MINER."—Your query is one which, to do it full justice, would require a rather voluminous answer. The losses occasioned in hydraulic and cement mining may be divided into two classes—one arising from the imperfect pulverization of the cement, may be obviated by employing crushing machinery; the other, and more general loss, takes place in consequence of the loss sustained by what is termed "float gold" passing off in a finely divided state. We know of no suggestion which could be offered to remedy or palliate the latter evil, unless by employing a long series of Rittinger's Pointed Boxes, which are described in this number, the overflow being made to pass from each series as much as possible over a well amalgamated plate maintained constantly clean.

"H. B."—"ASBESTOS" is from a Greek word of the same name. It is found to some extent in California, in the filiform condition, and very largely in the semi-formed or compact state. You cannot get a patent upon it for lamp-wicks. It was used for this purpose by the ancients.

A VALUABLE PUBLICATION.—We have received from H. H. Bancroft & Co. a copy of "Molesworth's Pocket-Book for Civil and Mechanical Engineers." It is a very complete compilation of the formulae and tables so often required for calculations in the field and elsewhere, but which few engineers pretend to commit to memory. It is in compact and convenient form, and will be found useful by the general public as well as by professional engineers. It is the first American from the tenth London edition.

OUR NEW TYPE will be appreciated by the reader for its clear, plain and bold face.—It is California made type, and the first font of the kind used on the Pacific Coast. The "metal" appears "tough" and we believe the "face" of the type will prove very durable.

## VOLUME FOURTEENTH.

Again the march of time has brought us to the commencement of a new year and a new volume. With the present issue we commence the "fourteenth" semi-annual volume of the MINING AND SCIENTIFIC PRESS. In thus entering upon a new term, it is needless to inform our patrons that the PRESS has kept full paco with the general prosperity which has attended mining operations of late throughout the Pacific coast, and that we take a just pride in recording, year after year, fresh evidences of success in our efforts to furnish our readers with a first-class mining journal, and one which shall compare favorably with any publication of the kind, wherever it may be sought for. As a special evidence of our desire to keep fully up with the times, and to make good our intent just recorded, we may call attention to the improved appearance of our paper to-day, which is printed on NEW TYPE of beautiful face and finish, and that, too, of California manufacture; thus practicing the duty we are constantly holding up to others—to support our own manufacturing and mechanical industries. While laboring faithfully and industriously in our chosen field, we owe our patrons and readers many thanks for the unmistakable evidences of appreciation with which they have received our efforts. For the future, we have only to say, that we shall continue, as in the past, our utmost endeavors to make the PRESS all that is desirable as a medium for the collection and dissemination of whatever can be made useful in advancing the mining, mechanical and general interests of the Pacific coast.

It will still, as heretofore, be our aim to stimulate all honorable enterprises; to raise a warning voice against all wild and reckless speculations; to record passing results; to marshal in appropriate order all the important discoveries and suggestions of the day, whence our readers may extract lessons of wisdom, whether in the paths of science or of industry. It is thus, that with growing years we hope to make our journal a faithful record of all that is useful or instructive, and so connect it with passing time, that it will, in the future, be found such an indispensable book of reference, that it will be sought for in every library which lays any claim to extent or completeness.

With this in view, we would again urge upon our readers the importance of filing their papers. We have now commenced a new volume, and a proper opportunity is presented to those who have heretofore neglected this duty, to commence it at once. Every reader of the MINING AND SCIENTIFIC PRESS should put the sheet regularly on file, where it may always be had for reference when wanted. In after years it will be worth and will command much more than its first cost.

The beginning of a new volume also presents a good opportunity for commencing a subscription. Our present issue will find its way to many new readers. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the

attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

## RITTINGER'S FUNNEL OR POINTED BOXES.

In our last issue, we spoke of these boxes as about being introduced for the separation of sands at the Eureka mill, Grass Valley. They have been employed for many years both in England and on the Continent of Europe, where they appear to give much satisfaction. They are used to separate or assort the sand into sizes, as a preparatory measure for concentration by other machinery. The great lack of success in concentration on this coast has arisen from the attempt to concentrate direct from the batteries, without a previous assortment into sizes—a thing impossible of successful accomplishment, and one which is never attempted in Europe.

The use of Rittinger's boxes, for this purpose, at the Eureka mill, will be the first attempt of the kind, so far as we are aware, on the Pacific coast, and as their success will doubtless be looked for with much interest, we shall not fail to report the same. Although these boxes are exceedingly simple in construction, cheap, and work without any especial attention, it is exceedingly difficult to describe them so as to be intelligibly understood; yet we will undertake to condense a description of them from Kustel's forthcoming work—the "Gold and Silver Processes of California and Nevada," where the same are fully described and illustrated. They consist simply of a series of boxes, usually four in number, each box increasing in size, and of about the following proportions:

First box, 6 feet long, 22½ feet wide, 4 feet deep.  
Second box, 9 feet long, 5 feet wide, 6 feet deep.  
Third box, 12 feet long, 9 feet wide, 8 feet deep.  
Fourth box, 16 feet long, 15 feet wide, 10 feet deep.

The difference of the water level between the boxes should be about eighteen inches. The sands are run direct from the battery into the first box, from that to the second, and so on. The boxes, instead of being made with rectangular sides and bottom, are formed like an inverted pyramid, with the lowest part coming to a point. At this point is a small orifice, through which the discharge is effected, with a very little escape of water. The discharge is not direct; but is made through a short pipe six or eight inches long, and about an inch in diameter, which is bent upwards along one of the under sides of the box, for some six inches or more, according as it may be found necessary to properly counteract the pressure of water within the box. This arrangement is attached to each of the boxes.

The sands flowing from the battery into the first box, discharge therein all their coarse particles, while those of a size much smaller are held suspended in the current,

and carried forward to the next box, which is made larger as above described, and so on. The result of this mode of separation with crushing of ordinary fineness, as ascertained by careful experiment, is given as follows:

The first box gives 40 per cent; the second 22; the third 20, and the fourth 12 of the crushed ore; leaving 6 per cent. as the finest slum. A cubic foot of water coming from the first box has been found to contain sixteen pounds of sand; that from the second box 13¼ of very fine sand; from the third box sixteen pounds of slime; from the fourth box twelve pounds of exceedingly fine slime.

These different sizes should then be each treated for concentration of their valuable constituents (sulphurets, etc.) separately, on any ordinary percussion table, such as those now in use for this purpose in our mills. The sand from the first and second boxes is easily treated; that from the third and fourth is more difficult of treatment, and requires a large amount of water. The work, when done, however, is thoroughly effected.

If grinding pans are to be used for the sands so treated, they should be employed after concentration, and upon the sand alone, after the sulphurets have been removed for treatment by roasting.

It may not be out of place in this connection, to mention the results of several experiments made at the Eureka mill, with the view of determining the relative advantages between working sulphurets by the chlorination process and by pans. The sulphurets from this mine assay very uniformly. From a lot which yielded by assay \$460 per ton, the maximum yield, without roasting, by the most careful pan process, aided to some extent by chemicals, was \$366—about 80 per cent. Sulphurets from the same pile, after being roasted, yielded but \$240; showing that for pan working, a better yield can be obtained from raw sulphurets than from those which have been roasted. The unroasted sulphurets were worked eighteen hours in the pan; we are not able to say how much time was occupied in working the roasted sulphurets.

Sulphurets from the same lot worked by Mr. Maltman, by chlorination process, yielded 90 per cent. Mr. Deetken by improved apparatus, expects to work them up to 95 per cent. His work, at Meadow Lake, has even exceeded that. The present charge for working sulphurets, by chlorination process, at regular sulphuret works, is \$40 per ton—the sulphurets delivered at the works. Mr. Deetken expects by his improved facilities, as described in our last issue, to work them for about \$6 per ton. If he succeeds in obtaining 95 per cent. of the gold for even \$12, he will have made a most important advance in this intricate branch of metallurgy. The ore from this mine yields about \$60 per ton in free gold, and \$5 per ton in sulphurets.

"ELECTRO-SILICON; OR MAGIO-BRILLIANT," is the designation applied to a new polishing powder, recently introduced to the public by Messrs. Frink & Edgar, at 212 Fourth street, in this city. This polishing powder is a natural mineral, "direct from nature's laboratory," as prepared by her handicraft in some portion of our neighboring State of Nevada. For gold and silver plate, Britannia, tin and any other kind of metal, whose brilliant luster is desirable, without any wear of the surface, this polish appears most admirably well calculated. It seems to form a kind of chemical union with the oxyds of the metals to which it is applied, thereby removing the tarnish without any apparent wear of the metal itself. The mineral constituents of the substance have not yet been determined, but measures have been taken to have a careful analysis made of it, which it is supposed may lead to new applications of this curious substance.

COMMUNICATIONS RECEIVED.—"Mines of Central Nevada," by J. D. Emersley; "Light for the Mines," by J. Mosheimer.

LIST OF OFFICERS OF CORPORATIONS  
AND MINING COMPANIES.

(PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.)

[Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.]

**DEL NORTE COMSTOCK M. Co.**—Dec. 3. Trustees: I. Bluxome, Wm. J. Bailey, C. Storm, Daniel Froese, R. N. Van Brunt. President, R. N. Van Brunt; Secretary, Charles F. Schulze; Treasurer, John Sime; Superintendent, Wm. H. Woodbury.

**JEFFERSON G. & S. M. Co.**—December 12. Trustees: Henry Videau, Andrew J. Snyder, Henry J. Booth. President, Henry Videau; Secretary, C. V. D. Hubbard; Treasurer, Andrew J. Snyder; Superintendent, Wm. P. Jones.

**NACASSARI G. S. & C. M. Co.**—January 2. Trustees: H. D. Bacon, C. J. Brenham, George Platt, Levi Stevens, E. F. Clark, Edward Heighton, T. B. Bigelow. President, H. D. Bacon; Secretary, T. B. Bigelow; Treasurer, John Sime.

**OPHIR S. M. Co.**—December 19. Trustees: Edward Martin, Wm. H. Osgood, John C. Clark, Wm. B. Johnston, Jesse Holladay, L. W. Coe, George Platt. President, Ewd. Martin; Vice President, Wm. H. Osgood; Secretary, Robert George; Treasurer, Wm. C. Ralston; Superintendent, P. J. Buckminster.

**PEACOCK C. N. & C. M. Co.**—Nov. 12. Trustees: B. B. Redding, R. C. Gaskill, A. J. Snyder, Jno. F. Miller, Geo. C. Gorham. President, Gen. Jno. F. Miller; Secretary, C. V. D. Hubbard; Treasurer, A. J. Snyder; Superintendent, R. C. Gaskill.

## RECENT INCORPORATIONS.

**MISSION WOOLEN MILLS.**—Capital stock, \$500,000; 100 shares; \$5,000 per share. Trustees, Donald McLennan Alex. Weill, David Cahn.

**PACIFIC O. & L. WORKS.**—Capital stock, \$600,000; 6,000 shares; \$100 each. Trustees: J. Bensley, L. B. Benchley, B. P. Brunner.

**SAN FRANCISCO PHOTOGRAPHIC ARTISTS' ASSOCIATION.**—Capital Stock, \$25,000; 100 shares; \$250 per share. Trustees: Wm. Dickman, D. H. Woods, J. C. Chalmers.

**TANCOB B. G. Co.**—Table Mountain Mining District, Butte county, Cal. Capital stock \$500,000; 5,000 shares; \$100 per share. Trustees: H. Caselli, Jos. W. Winans, O. P. Sutton. December 1.

**SPECIMEN HUNTING** is now all the rage in Grass Valley. The rain-wash has exposed several of considerable size, the largest of which reported is two pounds nine ounces. Another weighed thirteen ounces.

**SPECIMENS FROM BOISE CITY.**—We have received a box of specimens from Mr. H. W. O. Margary, of Boise City, I. T., which will be duly noticed in our next.

## City Amusements.

**METROPOLITAN.**—"Mazlum; or, The Night Owl," has been put on in fine style by the Martinetti troupe, and the crowded houses show that their efforts are appreciated by the public. The pantomime, together with the ballet and introductory performance by the Howsons and Edouin, form an entertainment which should satisfy every one.

**OPERA HOUSE.**—"Arrah-na-Pogue" has been revived here during the past week with good success. Although it had a long run the first time, it seems to be a favorite still, and finds many who do not tire of seeing it more than once. Next Wednesday is announced as Lady Don's last appearance and benefit night.

**ACADEMY OF MUSIC.**—We are promised a short season here by Blaise's Japanese troupe, commencing on Monday night.

**WOODWARD'S GARDEN.**—New attractions are being constantly added to the fine collection here, making it a favorite place of resort to those who wish to pass an hour or two pleasantly.

**PACIFIC HYGIEN HOME WATER CURE,** at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygien Home Association (Incorporated), B. J. Smith, M. D., Consulting Physician; R. S. MacArthur, M. D., Attending Physician; W. G. W. Harbison, Manager; H. Anderson, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-14

**OLNEY & Co.,** Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

**Air Pump for Sale.**—One of Tuto's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 2v13-9p

## To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 16v13-17c

## Boiler Makers and Sheet Iron Workers.

Mission Street, between Beale and Fremont, San Francisco.

N. B.—All kinds of Boiler and Sheet Iron Work executed at the shortest notice, and on the most reasonable terms. 17v12-14p1f

MOYNIHAN &amp; AITKEN.

## HEPBURN &amp; PETERSON'S PANS AND SEPARATORS.

For Reducing and Amalgamating Gold and Silver Ores.

We invite the Mining Public to examine the record of our Machines before adopting any other for producing similar results. They have been in general use for the past three years, during which time they have been repeatedly tried in comparison with every other machine of note, and of a similar nature, and have invariably been adopted in preference; which facts we offer as the most suitable recommendation, and which is attested by the following list of

**NITRO-GLYCERINE AGAIN.**—A man was killed at Rochester the other day, by the accidental explosion of fifteen pounds of this substance, which was being used for blasting purposes. Two others were fearfully injured.

## Consumption Cured.

FULTON, Hamilton Co., Ohio, May 19, 1883.—Gents: This is to certify that my daughter was taken with a severe cold, which settled upon her lungs, attended with violent coughing. The cough became incessant and distressing, with pain and great difficulty of breathing. It went on until she could not sleep, and she was unable to get up. She was almost gone, and that they believed she could not be cured, as she had the last stages of consumption. At this time she was induced to try ALLEN'S LUNG BALM, having heard of its many remarkable cures. On using the Balm, it seemed to go to the very seat of the disease at once, as it caused her to expectorate large quantities of phlegm and mucus. The attending physicians examined her, and said that they thought one of her lungs was almost gone, and that they believed she could not be cured, as she had the last stages of consumption. At this time she was induced to try ALLEN'S LUNG BALM, having heard of its many remarkable cures. On using the Balm, it seemed to go to the very seat of the disease at once, as it caused her to expectorate large quantities of phlegm and mucus. The attending physicians examined her, and said that they thought one of her lungs was almost gone, and that they believed she could not be cured, as she had the last stages of consumption. By the use of only three bottles, she, to all appearances, had recovered her health, and now feels as well as ever. Respectfully, yours, LUCIUS PICKER.

Sole by all Medicine Dealers everywhere. 1v14-1m

## WANTED!

A PARTNER OR PURCHASER

—FOR A—

Valuable Mining Invention,

MEETING A GENERAL WANT.

Apply to the PATENT DEPARTMENT  
of Mining and Scientific Press,  
1v14 505 Clay street, San Francisco.

## GREGORY YALE,

Attorney and Counsellor at Law,

No. 18 Merchants' Exchange,

(Battery and Washington streets).

Special attention given to obtaining Patents for Mining Lodes under the Act of Congress of July 20th, 1866; and Claims filed before the U. S. Registers and Receivers in any of the Land Districts in the State, and Contests before the Courts, under the Law, attended to. Opinions prepared upon all questions relating to Mining Laws. 1v14-1m

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m

JAMES HITCHENS.

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF

FLAT &amp; ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—" "

**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope**—For Slips, Bights, Derrick guys, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**—3/4 to 1 1/2 inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on band.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

**RIGHTS OF FOREIGNERS HOLDING FRENCH**  
PATENTS.—Commissioner Gen. Beckwith,  
in a letter to the Secretary of State, dated  
November 7th, says he addressed an inquiry  
to the Imperial Commission some time  
since concerning the legal right of foreign-  
ers holding French patents for their inven-  
tions, to exhibit and afterward sell the  
foreign made products thus patented in  
France, without forfeiture of the French  
patent. The Imperial Commission referred  
the inquiry to the Ministers of Commerce,  
and were informed that, in the opinion of  
the government, such exhibitions and sale,  
if duly authorized by the Minister of Com-  
merce, would not operate a forfeiture of  
patent, but that the decision of questions  
touching such forfeiture belonged to the  
courts of law. Mr. Beckwith inclosed  
copies of the correspondence, copies of  
which he had sent to Mr. Derby, at New  
York, for the information of patentees whom  
it may concern.

**WE ARE NOW OFFERING**

of Mr. LOCHHEAD, who has been in the business in San  
Francisco for the last fourteen years, and enjoys the re-  
putation of having built ONE HUNDRED AND SEVENTEEN  
STEAM ENGINES

Screw Propellers of all kinds, and Steam Boat Machinery  
generally, made to order, and warranted to give perfect  
satisfaction in every particular. 25v12-3m

Owing to its general circulation, the MINING AND SCIENTIFIC  
PRESS has perhaps been as valuable and useful to the  
mining interests as that noted paper, the "London & Lan-  
cet," was to the medical profession, acting either as a  
scourge when too great a plethora of mining bubbles pro-  
vailed, or as a styptic where dangerous bleeding of the  
pockets of the capitalists was concerned.—[Copperopolis  
Courier, Oct. 13

**AUSTRALIAN GOLD AT THE PARIS EXHIBITION.**—It is intended to forward to the Paris Exhibition a pyramid, representing the space which would be occupied by all the gold produced in Victoria during the last fifteen years. The height of the pyramid will be fifty feet ten inches, and at the base it will measure ten feet square. Its cubic measure will be 1,994 feet, and it will represent a weight of 1,071 tons 3 qrs. 12 lbs., of the value of \$700,000,000. Why cannot California get up a similar exhibition of her auriferous production. A gilt pyramidal representation of the gold and silver product of the Pacific coast, would be something worth looking at.

## BELLAMBI COAL!

A SUPERIOR ARTICLE OF  
**SMITHS' COAL,**

FOR SALE IN QUANTITIES TO SUIT,  
At Greatly Reduced Rates.

Sacked to order for Shipment to the Country.

Apply to

**FLINT, PEABODY & CO.,**

184 Montgomery 408 CALIFORNIA STREET, San Francisco.

## Bell's Assay Office.

THE UNDERSIGNED, HAVING FORMED A PARTNERSHIP this day, would inform the former patrons and the public generally, that they will continue the ASSAY BUSINESS in all of its branches, at the old stand,

No. 512 California street,

One door west of Montgomery, San Francisco, with the same employees, under the name of Rogers & Brown. Mr. EDWARD WOLFE, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of Mr. HENRY J. FISHER, for ten years in the United States Mint in this city and Philadelphia, and for the past seven years with Mr. Bell.

We would inform Photographers that we are prepared to work their chlorides of silver and ashes from their paper clippings.

We have, in connection with our Assay business a Mill, and are prepared to

**WORK GOLD AND SILVER ORES,**  
in quantities from 25 to 500 pounds; also, Assayers' Sweeps.  
**GEORGE E. ROGERS,**  
**H. W. BROWN,**  
October 13, 1866.

## CONNECTICUT

### Mutual Life Insurance Co.

The Largest Life Insurance Com-  
pany in the World.

ASSETS.....\$12,000,000.

## THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE  
Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Business,  
The Largest Income,

And as it obtains the LARGEST average rate of interest on  
its investments, and has had, through its whole history,  
the SMALLEST average expenses, it therefore affords in-  
surance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy  
Holders during the current year is SIXTY PER CENT. of the  
premiums paid during the year ending 31st of January,  
1865.

Insurance can be effected in this Company in all the  
forms desired, and to meet all the contingencies to which  
Life Insurance is applicable, among which forms are—

**Whole Life Policies,** by a continued annual life  
premium.

**Whole Life Policies,** by TEN annual premiums.  
**Endowment Policies,** by a continued annual  
premium.

**Endowment Policies,** by a limited annual pre-  
mium, for FIVE, TEN, FIFTEEN or TWENTY years.

**Endowment Policies,** made payable at any age  
stipulated.

ALL POLICIES issued by this Company are either non-  
forfeitable by their terms, or may be converted into those  
which are so, at the option of the insured.

This Company offers all the advantages of a CASH or  
NOTE Company. The assured are not required to give a  
note in part payment of the premium, but may, if prefer-  
red, pay the first four premiums in cash after which their  
dividends on Annual Premium Life, and Continued Pre-  
mium Endowment Policies, will, in the past success of the  
Company is continued, reduce their premiums ONE HALF.  
When notes are given for Annual Life and Continued En-  
dowment Premiums, no notes will be required after the  
fourth payment, and the returned surplus—dividends—  
will be applied as cash to the reduction of the annual  
premium.

None but Unexceptional Risks Accepted; and  
only upon ages between Fourteen and Sixty.

San Francisco. 17v13-1p11

## Accidental Insurance!

### The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF  
all kinds, and death resulting from accident.  
In case death does not result from the injury, the insured  
receives a weekly compensation as long as he is disabled  
(not to exceed twenty-six weeks).

## ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensa-  
tion of \$5.  
\$10 will buy Policy for \$2,000, with weekly compensa-  
tion of \$10.  
\$50 will buy Policy for \$10,000, with weekly compensa-  
tion of \$50.

## SHORT TERM POLICIES.

Policies will also be issued for any other amounts within  
the limits before stated, for periods of one to six months,  
at rates in tenths of the Annual rate, as follows:

1 month,	2-10.	4 months,	5-10.
2 "	3-10.	5 "	6-10.
3 "	4-10.	6 "	7-10.

## GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by  
many of its Agents at Hotels and Ticket Offices through-  
out the country.

They make Insurance for \$5,000, and \$25 per week com-  
pensation, against Accidents of every description, traveling  
or otherwise; good for one to six days, as required, at  
TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which  
cover only injury or death, the result of an "Accident to  
the Public conveyance in which the assured may at the  
time be traveling," but they are GENERAL ACCIDENT  
TICKETS.

## SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and  
other Ports. Rates varying with the season, and the voy-  
age to be taken. Information can be had of the Company  
or its Agents.

The Company has a PAID UP CASH CAPITAL OF  
\$250,000. One hundred thousand dollars deposited with  
Wm. Barnes, Esq., Superintendent of the Insurance Depart-  
ment of the State of New York, and the remainder securely  
invested in Stocks in the hands of the Company.

## INDUCEMENTS!

The rates of Premium are very low.  
The Plan is so simple that any one can comprehend all  
its workings.

No MEDICAL EXAMINATION is required, and those who  
have been rejected by Life Companies, in consequence of  
hereditary or other diseases, can effect Insurance in this  
Company at a very small cost.

No better or more satisfactory use can be made of so  
small a sum.

For Policies or further information, apply to

## A. D. SMITH & CO.,

General Agents for the Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets,  
San Francisco. 17v13

**WAKING A MAN BY TELEGRAPH.**—The London telegraphic operator, whose business it is to send the reports by a special wire to a Glasgow morning journal, found the office closed the other night, and the porter asleep. He drummed frantically upon the said door until he got tired, without succeeding in awakening him. There was no one else in the building except the clerk in the operating room, at the top of the six story building. It would, of course, be useless to attempt to communicate with him. So he went to an adjoining telegraph station, and sent a message to the company's office in Glasgow, 400 miles distant, requesting the clerk there to telegraph the London clerk to "go down stairs and arouse the porter." This was done, and in about twenty minutes he succeeded in effecting an entrance.

At Solingen, in Germany, sword blades equal to the famed ones of Damascus are said to be made. A faggot is first formed of alternate fine bars of iron and steel. It is drawn out, doubled and twisted several times, and then formed into a ribbon. Two such ribbons are welded together, enclosing between them a thin blade of the best cutting English steel. After polishing, it is dipped in dilute sulphuric acid to give it a pattern.

The Canadian savants cannot determine whether the reported gold discoveries are genuine or not. There is some reason to suspect that the old California trick of "salting" has been practiced by interested parties. At any rate, the shaft which has been sunk is guarded with a degree of care which is somewhat suspicious.

THE MOLDS for electrotyping may be coated with an alcoholic solution of acetate of copper of nitrate of silver, by means of a brush, and then submitted to the action of sulphureted hydrogen. When dry, they are ready for use. This is superior to the coating where plumbago is used.

THE fact that iron is converted into steel by the absorption of carbon alone, has been proved by drilling a hole in a lump of iron, introducing some small diamonds, and hermetically sealing the opening. By subjecting the lump to heat, it became steel.

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of stuffed Birds, Shells, and Wax Flowers, besides Feathers, Birds and Butterflies, for tadies' hats, Shells, Sea-weeds, etc. 24v13-gr

**EUROPEAN**  
**METALLURGICAL WORKS,**  
—AND—  
**Practical Mining School,**  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuret, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the limit and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting,  
refining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. P. KIMBALL. J. R. MURPHY.  
10v10

**MOSHEIMER'S**  
**Metallurgic Works**  
And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gic Works, and is prepared to reduce any kind of Ores,  
by Smelting, Amalgamating, or other processes, that the  
nature of the ore may require.  
Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.  
Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.  
CONSULTATION OFFICE:  
423 Washington street, San Francisco.  
J. MOSHEIMER,  
25v13-3m Engineer and Metallurgist.

**City College Laboratories,**  
Southeast Cor. Stockton and Geary sts.

**Practical and Analytical Chemistry**  
and Metallurgy.  
**THOMAS PRICE,**  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALI-  
tative and Quantitative Analysis and Assaying. The  
course qualifies students for the application of Chemistry to  
METALLURGY, MANUFACTURING ARTS, and MINING  
PURPOSES.  
**PHARMACEUTICAL and TECHNICAL CHEMISTRY,**  
such as is required by Medical and Pharmaceutical Stu-  
dents, will be taught to such students as may require it.  
**Course of General Chemistry.**

Evening Lectures will be delivered every Tuesday, at  
half-past seven o'clock, P. M., in the Philosophical Hall of  
the College, without extra charge to the students in the in-  
stitution.  
On and after the 14th of February, the Laboratories will  
be open every day, except Sundays, from 8 A. M. to 5 P. M.  
For further particulars, address  
**REV. P. V. VEEDER,**  
Principal of the City College.  
5v12eov1f Or at 406 California Street.

**PATENT BUSINESS.**  
We have lately associated with us in the Patent and Me-  
chanical Department of the MINING AND SCIENTIFIC PRESS, a  
gentleman of superior ability and attainments, who has  
arrived direct from the leading patent agency in New York  
City, and having a faithful and reliable associate in Wash-  
ington City, we are now better than ever before prepared  
to secure the claims of our applicants, in a careful, prompt  
and efficient manner.  
**DEWEY & CO.,**  
San Francisco, June, 1886. Patent Solicitors.

## New Mining Advertisements.

**Dios Padre Gold and Silver Mining Company,**  
Alamos, Mexico.

Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment levied on the  
fourth day of December, 1886, the several amounts set op-  
posite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
William Bihler.....	299	20	\$60.00
William Bihler.....	323	5	15.00
William Bihler.....	411	15	45.00
William Bihler.....	389	25	75.00

And in accordance with law, and an order of the Board of  
Trustees, made on the fourth day of December, 1886, so many  
shares of each parcel of said stock as may be necessary, will  
be sold at public auction, by Messrs. Olney & Co., 418 Mont-  
gomery street, San Francisco, Cal., on the twenty-second  
day of January, 1887, at the hour of 12 o'clock M. of said  
day, to pay said delinquent assessment thereon, together  
with costs of advertising and expenses of sale.

E. C. McCOMB, Secretary.  
Office, No. 1 Government House, corner Sansone and  
Washington streets, San Francisco, Cal. jan5

**George Washington Gold and Silver Mining**  
Company.—Location of Works: Silver Mountain District,  
Alpine County, Cal.  
Assessment No. 16.

Notice is hereby given, that at a meeting of the Board  
of Trustees of said Company, held on the thirty-first day  
of December, 1886, an assessment of one dollar and fifty  
cents (\$1.50) per share was levied upon the capital stock  
of said Company, payable immediately in United States gold  
and silver coin, to the Secretary, at the office of the  
company, only.

Any stock upon which said assessment shall remain un-  
paid on the twenty-first day of January, 1887, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Monday, the twenty-fifth day of February,  
1887, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

A. C. WOOD, Secretary.  
Office, 338 Montgomery street, San Francisco. jan5

Vandervoort, J. C.....	28	50	100.00

And in accordance with law, and an order of the Board of  
Trustees, made on the fourth day of December, 1886, so many  
shares of each parcel of said stock as may be necessary  
will be sold at the auction rooms of Maurice Dore & Co.,  
No. 327 Montgomery street, San Francisco, California, on  
Tuesday, the twenty-second day of January, 1887, at the  
hour of 12 o'clock, M., of said day, to pay said delinquent  
assessment thereon, together with costs of advertising and  
expenses of sale.

R. N. VAN BRUNT, Secretary.  
Office, 331 Montgomery street, San Francisco. jan5

**Ophir Silver Mining Company.—Location of**  
Works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on this twenty-fourth day  
of December, 1886, an assessment of five (\$5) dollars per  
share was levied upon the capital stock of said Company,  
payable in United States gold coin, on the twenty-ninth  
day of December, 1886, to the Secretary, at the office of the  
Company, Nos. 4 and 5 U. S. Court Building, corner of Jack-  
son and Montgomery streets, San Francisco, California.  
Any stock upon which said assessment shall remain un-  
paid on the twenty-eighth day of January, 1887, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on the fifteenth day of February, 1887, to  
pay the delinquent assessment, together with costs of ad-  
vertising and expenses of sale.

And in accordance with law, and an order of the Board of  
Trustees, made on the twenty-fourth day of November, 1886,  
so many shares of each parcel of said stock as may be nec-  
essary, will be sold at public auction, by Olney & Co., No.  
418 Montgomery street, San Francisco, Cal., on the fourteenth  
day of January, 1887, at the hour of 12 o'clock M. of said  
day, to pay said delinquent assessment thereon, together  
with costs of advertising and expenses of sale.

J. M. BUFFINGTON, Secretary.  
Office, No. 10 Government House, San Francisco. dec29

**Cosima Silver Mining Company, Cosima District,**  
State of Arizona, Mexico.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the seventeenth day  
of December, 1886, an assessment of one dollar (\$1)  
per share was levied upon the assessable capital stock of  
said Company, payable immediately, in United States gold  
and silver coin, to CHAS. BAUM, Secretary, at the office of  
this Company, 510 Battery street, opposite the Custom  
House, San Francisco.

Any stock upon which said assessment shall remain un-  
paid on the twenty-first day of January, 1887, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Monday, the eleventh day of February,  
1887, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

CHAS. BAUM, Secretary.  
Office, No. 610 Battery street, opposite the Custom House,  
San Francisco, Cal. dec22

**Great Central Mining Company.—Location of**  
Works: Yuma County, Arizona Territory.

Notice is hereby given that at a meeting of the Board of  
Trustees of said Company, held on the twenty-fourth day  
of December, 1886, an assessment of one dollar (\$1) per  
share was levied upon the capital stock of said Company,  
payable immediately in United States gold and silver coin,  
to the Secretary and Treasurer, at the office of the Com-  
pany, No. 302 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid  
on the twenty-sixth day of January, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Thursday, the fourteenth day of February, 1887,  
to pay the delinquent assessment, together with costs of ad-  
vertising and expenses of sale. By order of the Board of  
Trustees.

O. D. SQUIRE, Secretary.  
Office, No. 302 Montgomery street. dec29

**Hanscom Copper Mining Company.—Location:**  
Low Divide District, Del Norte County, California.

Notice is hereby given, that the Annual Meeting of the  
shareholders of the above named Company will be held on  
FRIDAY, the 21st day of December, 1886, at 7 o'clock P.  
M., at the office of Hanscom & Co's Elina Iron Works,  
Fremont street, near corner of Tehama street, San Francisco,  
for the election of Trustees to serve the ensuing year, and  
for the transaction of other business.

S. S. SWEET, Secretary.  
dec5

The above meeting was adjourned to Thursday, January  
3d, 1887, at the same hour and place.

S. S. SWEET, Secretary.

**Hanscom Copper Mining Company, Low Di-**  
vide District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-second day  
of December, 1886, an assessment of fifteen (15) cents per share  
was levied upon the capital stock of said Company, payable  
immediately in United States gold and silver coin, to the  
Secretary, at 609 Market street, San Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the twenty-second day of January, 1887, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Friday, the eighth day of February,  
1887, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

S. S. SWEET, Secretary.  
Office, No. 609 Market street, San Francisco, Cal. dec29

**STOCK CERTIFICATES,**  
**STOCK TRANSFER JOURNALS,**  
**STOCK LEDGERS,**  
**ASSESSMENT RECEIPTS,**  
And all other Blanks, Blank Books, etc., required by  
Mining and other Corporations, kept on hand or printed to  
order on short notice, at moderate prices, at the office of  
the MINING AND SCIENTIFIC PRESS.

**American and Foreign Patents.**—Letters Patent  
for Inventions can be secured in the United States and foreign  
countries through the MINING AND SCIENTIFIC PRESS PATENT  
AGENCY. We offer applicants reasonable terms, and can  
assure them of a strict compliance with our obligations,  
and a faithful performance of all contracts. For reference,  
we will furnish the names of numerous parties for whom  
we have obtained patents during the past two years.

**Hope Gravel Mining Company.—Location of**  
Works: Grass Valley, Nevada County, California.

Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment (No. 1) levied on the  
fifteenth day of November, 1886, the several amounts set  
opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Brown, S. G.....	57	60	\$30.00
Brown, S. G.....	58	10	10.00
Brown, S. G.....	59	10	10.00

Madge, Fred.....	51	12	12.00
Sherry, James.....	17	156	156.00
Wood, John H.....	59	100	100.00

And in accordance with law, and an order of the Board of  
Trustees, made on the fifteenth day of November, 1886, so  
many shares of each parcel of said stock as may be necessary  
will be sold at public auction, at the salesroom of Cobb &  
Sinton, No. 407 California street, San Francisco, California,  
on Tuesday, the fifteenth day of January, 1887, at the hour  
of 12 o'clock, noon, of said day, to pay said delinquent as-  
sessment thereon, together with costs of advertising and ex-  
penses of sale.

DAVID WILDER, Secretary.  
Office, No. 529 Clay street, San Francisco, Cal. dec29-3v

**Josephine Copper Mining Company, Gopher**  
District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-eighth day of  
November, 1885, an assessment of one dollar (\$1) per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin, to the  
Secretary, E. C. McCOMB, No. 1 Government House, San  
Francisco, Cal.

Any stock upon which said assessment shall remain un-  
paid on the fifteenth day of January, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public au-  
ction, and unless payment shall be made before, will be sold  
on Monday, the fourth day of February, 1887, to pay the de-  
linquent assessment, together with costs of advertising and  
expenses of sale. By order of the Board of Trustees.

E. C. McCOMB, Secretary.  
Office, No. 1 Government House, corner Sansone and  
Washington streets. dec15

**Keystone Mining Company, Location of Works**  
Copperopolis, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-first day of  
November, 1886, an assessment of ten dollars (\$10) per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold coin, to the Secre-  
tary, at this office, No. 440 California street, San Francisco,  
California.

Any stock upon which said assessment shall remain un-  
paid on Monday, the twenty-first day of January, 1887, shall  
be deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made before,  
will be sold on Monday, the eleventh day of February,  
1887, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

O. P. SUTTON, Secretary.  
Office, 440 California street, San Francisco. no24

**Melones and Stollins Gold, Silver and Cop-**  
per Mining Company.—Location: Carson Hill or Flat  
Mining District, Calaveras County, California.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the thirteenth day of  
December, 1886, an assessment of two (\$2) dollars per share  
was levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin,  
to the Secretary, at the Company's office, 606 Montgomery  
street, San Francisco, California.

Any stock upon which said assessment shall remain un-  
paid on the fourteenth day of January, 1887, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment is not made before,  
will be sold on the fourth day of February, 1887, to pay  
the delinquent assessment, together with costs of advertis-  
ing and expenses of sale. By order of the Board of Trust-  
ees.

A. DE SENAILHAC, Secretary.  
Office, 606 Montgomery street, San Francisco, Cal. dec22

**Noaparril Gold Mining Company, Location of**  
Works: Toolumne County, California.

Notice is hereby given, that at a meeting of the Board  
of Trustees of said Company, held on the twenty-sixth  
day of December, 1886, an assessment of one dollar and  
fifty (\$1.50) cents per share was levied upon the capital  
stock of said Company, payable immediately, in United  
States gold and silver coin, to the Secretary, at the office  
of the Company, 423 Washington street, Room 5, San Fran-  
cisco.

Any stock upon which said assessment shall remain unpaid  
on the twenty-eighth day of January, 1887, shall be deemed  
delinquent and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Monday, the eighteenth day of February, 1887, to pay  
the delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.

S. A. ELDRIDGE, Secretary.  
Office, 423 Washington street, San Francisco. dec29

**Siskiyou Mining Company.—Location of Works:**  
Middle Fork of Humboldt Creek, in the County of Siski-  
you, State of California.

Notice is hereby given, that at a meeting of the Board  
of Trustees of said Company, held on the tenth day of  
December, 1886, an assessment of five (\$5) dollars per  
share was levied upon the capital stock of said Company,  
payable immediately, in United States gold and silver  
coin, to the Secretary, at the office of the said Company,  
No. 43 Exchange Building, N. W. corner of Montgomery  
and Washington streets, in the City and County of San Fran-  
cisco.

Any stock upon which said assessment shall remain un-  
paid on the twenty-first day of January, 1887, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made be-  
fore, will be sold on Wednesday, the twentieth day of Fe-  
bruary, 1887, to pay the delinquent

## THE EXCELSIOR GRINDER AND AMALGAMATOR.

In the engraving herewith presented, A represents the Rim of the Pan; B, Muller; C, Legs; D, Cross-Frame; E, Gearing; F, Screw; G, Lever; H, Dash-Boards; I, Key; a, Dies; c, Shoes, and o, Openings.

The relative grinding capacities of "The Excelsior" Grinder and Amalgamator, of the Flat Bottomed Pan, and of the Conical Pan when properly constructed, are respectively 177, 118 and 132.

That is, the respective mullers being of the same diameter, same weight, same hardness, and running at the same velocity "The Excelsior Grinder and Amalgamator" will reduce one hundred and seventy-seven tons of ore, the Flat Bottomed Pan one hundred and eighteen tons, and the Conical Pan one hundred and thirty-two tons to the same degree of fineness in the same time.

The wear to the Shoes and Dies at their grinding surfaces in the Excelsior Grinder and Amalgamator, is perfectly uniform, thus securing evenness of reduction to the pulp, as well as steadiness of motion to the muller. Uniform wear of the grinding plates has been attained in no other than that of the Tractory form—nor can it be.

Another property of excellence in this machine is that the metal or substance to be amalgamated passes direct from the grinding surfaces into the quicksilver; thus excluding the possibility of its becoming coated with any foreign substances, after having been furnished. It is truthfully said "that the Tractory-formed Pan as a Grinder is no equal, and as an Amalgamator no superior."

As a whole, it is far superior to any other pan in use.

MANUFACTURED AT THE

Union Iron Works and Golden State Iron Works.

WHEELER & RANDALL, Inventors.

The undersigned having had several years of experience in practical quartz mining operations, will ever take great pleasure in furnishing parties interested in mining and machinery any desired information which they may possess.

### Machinery.

V. CUSHING, Agent

—FOR THE—

Purchase & Shipping of Machinery  
OF ALL KINDS.

Especially attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to—

Governor F. F. Low; C. T. Meader, Stockton; Jacob Underhill & Co., San Francisco; J. W. Stowe, Russell & Erwin Manufacturing Company; Office, No. 120 Front street, San Francisco.

Cosley & Risdon, San Francisco; Geo. R. Givens, Chief Engineer of Cal. S. Nav. Co., San Francisco.

4v12

### HUNTER'S

IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

### VARNEY'S

PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and sellers for themselves, at the

PACIFIC FOUNDRY,

1v1

San Francisco.

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than ours have the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

The Press is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nyo County News.]

### LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

CALIFORNIA REFERENCES.—E. Stockton, Folsom; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. V. McMillan, Lexington, Santa Clara County. Send for Circular to

### BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

### THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
13v12 416 Market street, San Francisco.

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[O. V. National]

### Hunt's California Pump

Has all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years. Good judges have examined and pronounced them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 23 Second Street and 110 Jessie Street.

Also, Tread Horse Powers, Pumping Frames for Irrigating, Saw Frames, Sweep Horse Powers and Frames, all in one frame, the horse to travel around the frame.

### PRICES OF HUNT'S CALIFORNIA PUMPS.

No. 3—3-inch cylinder, 6-inch stroke.....	\$30 00
No. 4—3½-inch cylinder, 6-inch stroke.....	35 00
No. 5—4-inch cylinder, 6-inch stroke.....	45 00
No. 6—5-inch cylinder, 8-inch stroke.....	60 00
No. 8—8-inch cylinder, 12-inch stroke.....	90 00

A liberal discount made to the Trade.

For further particulars, send for Circular.

E. O. HUNT,

J. MARSHALL. W. WYLIE.

### GLASGOW

IRON AND METAL IMPORTING CO.,

No. 27 Fremont street,

SAN FRANCISCO.

Be to inform purchasers that they have just received a large stock of Glasgow and Staffordshire best refined

Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes,

GAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.

Country Orders punctually attended to. 19v13g

### STANDARD SOAP COMPANY'S WASHING POWDER,

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleaning. It is made of pure material, and contains nothing that will injure the finest fabric. Equally as good for using in hard as soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lb bulk. Ask your grocer for a package, and test its virtues. Manufactured at 207 Commercial street, San Francisco.

ELECTROTYPE CUTS, ENGRAVINGS, ETC.—Our Job Printing Office is abundantly supplied with elegant engravings, ornaments, and other embellishments to suit the various branches of industry in this State.

**COL. BUEL'S MINE AND MILL.**—From a letter to the "Territorial Enterprise," dated Belmont, Nyo county, December 20th, we condense the following: "Col. Buel commenced working the Highbridge mine, by removing the croppings the whole length of the ledge. The best of the rock was sent to Austin, but nearly all the balance was worked at his mill here. He has now reached a depth of twenty feet the whole length of the claim. This shows a well defined, compact ledge, seven feet in thickness, having increased in going down from four to seven feet, and containing better ore at the bottom than was found anywhere above. He has sunk an incline to a depth of twenty feet from the bottom of the cut made by the removal of the croppings, etc., which cut was about twenty feet in depth. At the bottom of this incline there is a streak three feet in thickness, every pound of which shows "horn silver," assaying seventy per cent. of pure silver. I visited the mine with Colonel Buel, a few evenings since. We found a large quantity of rock at the mine, which he estimated would mill not much short of \$500 per ton. I think his estimate moderate. The rock which he estimated would yield \$101 per ton looks inexhaustible." Colonel Buel effected his purchase of the mine about the first of June last. He immediately commenced to remove his mill from Austin and erect it here. The first load of machinery arrived on the first of June, and by the middle of August he was shipping large quantities of bullion, and has continued to do so ever since. Unfortunately for him, his mill is old and worn out, making frequent repairs necessary, and, of course, is often stopped for that purpose, which, for want of conveniences, makes the time consumed longer than it would be. But with all these disadvantages he succeeded in pouncing out \$28,000 worth of silver bricks last month. Working the mine and mill as they have been worked since starting, this mill alone will yield a net yearly income of \$120,000."

**COPPER IN NEVADA.**—The Reveille predicts a brilliant future for the copper mines of the State, to come when the projected railroad system is completed, and says:

We doubt if in any part of the world richer ores of copper, or in greater quantities, can be found. There are veins of copper in San Antonio, Palmetto, Clarendon and other districts on the south, in our own neighborhood, and in Ravenswood, Kinsley and Battle Mountain Districts lying to the north. From all of these, and many other sections, quite large quantities of ore are from time to time brought to this city for exhibition. As an instance of one mine, we will present the Dunderberg ledge, of Battle Mountain District, which is represented as being two hundred feet in width, and composed of the red oxyd of copper, quartz and limestone, with such an abundance of ore running in small veins through the mass, that miners engaged in prospecting the ledge say that enough could be obtained of fifty per cent. ore to give home freights to all the ships that come to San Francisco.

**THE EMPEROR OF BRAZIL,** whose promised visit to this country has already been announced, will be the guest of Prof. Agassiz during his stay in New England. The visit will take place as soon as the Paraguayan war has been brought to a close. The Emperor is one of the most enlightened rulers of the age. He is quite a philosopher, well versed in chemistry and other sciences, and an untiring student. His love of learning was fully exemplified in the interest he manifested in the recent trip of Prof. Agassiz and party to Brazil. His visit to this country has also been planned, in part, to gratify his inclination in this direction.

**NEVADA BULLION FOR 1866.**—The Esmeralda Union estimates the bullion products of this State, for the current year ending the first of next January, at sixteen millions of dollars—and that about thirteen millions was taken out of the Comstock ledge. The same paper says: "The mines of Nevada alone have furnished to commerce and the general business and trade of the country a metallic-money medium of exchange to the amount of sixty millions of dollars within the past six years."

**INDIANS FOR THE PARIS EXPOSITION.**—A party of North Western Indians, consisting of thirty-eight men, eight squaws and six children, with their war and agricultural implements, will leave New York about the 10th of March for Paris. They are sent at the urgent request of the Imperial Commissioner.

**JOHN TAYLOR & CO.,**

**Mayhew's Balsamic Hair Stimulant!**

THIS REPARATION HAS BEEN USED AND RECOM-  
mended by some of the most prominent members of the  
medical profession of this city.

For the removal of DANDRUFF, SCURF, for preventing  
the hair from falling off, and for producing a new growth,  
IT IS WITHOUT A RIVAL.

For particulars and references, see circulars accompany-  
ing each bottle. Prepared by

**W. E. MAYHEW, Druggist,**  
N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of  
Physicians' prescriptions.

Also, has constantly on hand a choice assortment of  
French, English and American Toilet Articles  
16v13-5w

**Important to Californians.**—Many inventors have  
lately had their claims for Patents seriously (and in some  
cases fatally) delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. The MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the regulations of the Department, and properly  
filed all necessary papers as Claim Agents.

We receive, regularly as clock work, this exceedingly  
valuable and interesting Journal.—[Napa Reporter.]

**Knox's Improved Patent Amalgamator and Separator,**  
With Palmer's Patent Steam Chamber or Die.

For further particulars, inquire of

14v13-12q

At the Golden State Iron Works, No. 19 First street, San Francisco.

**Machinery.**

**Brodie's Patented Improvements**

FOR THE TREATMENT OF

**Gold and Silver Ores.**

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully  
called to this improved Machine for Breaking or  
Crushing Quartz, or other Rock, possessing, as it does, sim-  
plicity of action and lightness of construction, so far as is  
compatible with strength and durability. In consequence  
of these advantages, the advertiser is enabled to offer  
these machines to the public at the following low terms:  
No. 1.—Or 10-inch Crusher, capable of reducing from  
three to four tons of quartz per hour, no piece be-  
ing larger than a walnut—price.....\$800  
No. 2.—Or 15-inch Crusher, capable of similarly pating  
through five to six tons per hour.....850  
No. 3.—Or 18-inch Crusher, will in a similar manner  
crush from seven to eight tons per hour.....1,300

**EXPLANATION OF THE ABOVE ENGRAVING.**  
The frame is made of cast iron, bound with heavy  
wrought iron bands, making it very strong, and at the same  
time light and portable. The crusher is bolted to a wood  
frame of sufficient light to clear the fly-wheel, and allow  
the crushed quartz to pass off. The dotted lines show the  
movable and stationary jaws. Letter A represents the  
eccentric shaft by which the power is applied direct to the  
movable jaw. B represents the movable jaw, and C the  
fixed jaw. D represents the link or radius bar. E repre-  
sents the bolts for regulating the opening, F, which can be  
regulated at pleasure, so as to graduate to the size to which  
it is intended the quartz shall be crushed. G represents the  
feed opening, by which the size of the machine is desig-  
nated.

The arrow on the fly-wheel shows the direction to drive  
the eccentric, which, in combination with the link, D, gives  
the movable jaw, B, a forward and downward motion at the  
same time, and which makes the hardest rock yield and  
separate into fragments of any desired size.

The above Crushers have been recently erected and are  
now successfully employed at Bear Valley, Mariposa county,  
Rawhide Ranch, Tuolumne county, Excelsior Mine,  
Lake District, Nevada county, and can be seen in operation  
at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of  
this Crusher, has been received from the Superintendent of  
the "Rawhide Ranch" Mine, in Tuolumne county:  
Rawhide Ranch, Tuolumne Co., Sept. 28, 1866.  
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives  
me pleasure to inform you that I have for the past three  
months had one of your largest sized Rock Crushers in  
use, at the Rawhide Ranch Mining Company's Mill, which  
is entirely met my expectations; and I have no hesita-  
tion in recommending it to all who are in need of a machine  
for rapidly, cheaply and properly preparing quartz for the  
stamps. Yours truly,  
R. P. JOHNSON,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGA-  
MATING BARREL.**—This Barrel obtained a premium at  
the Fair of the Mechanics' Institute in San Francisco, in  
1864. Further particulars will be afforded on application  
to the subscribers.

Those infringing the patent rights to the above improved  
Barrel, are hereby informed that on and after the 1st No-  
vember, 1866, the royalty charged for using the same will  
be raised to the sum of \$100 per Barrel.

A diagram, with explanations of this machine, will be  
found in the "Mining and Scientific Press," of September  
25th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR  
DRY CRUSHING.**—This Dry Crusher has been found the  
most economical and effective mode of crushing ores in  
Mexico, California and Nevada. Diagrams and explana-  
tions afforded on application to the subscribers.  
A drawing and full description of this machine will be  
found in the Mining and Scientific Press of Sept. 22d, 1866.  
**BRODIE & RADCLIFF,**  
Express Building, 402 Montgomery street,  
San Francisco.

**Notice to Miners,**  
**Well-Borers and Water Companies.**

**M. PRAG IS NOW PREPARED TO MANUFACTURE**  
Hydraulic and Artesian Well Pipes in the best work-  
manlike manner, and at the lowest market rates. Having  
made large additions to my stock of machinery for this  
branch of business, I am prepared to fill all orders with dis-  
patch, and guarantee entire satisfaction. I also manufac-  
ture Mississippi Stoves, of the latest improved patterns, for  
vessels of all classes. Also, Ship Humming-bells.  
M. PRAG,  
8v13-1y Stove Store, No. 125 Clay street, below Davis.

Such a journal has been needed on the Pacific Coast. The  
Press fills the bill.—[Reese River Reveille.]

THIS CUT REPRESENTS AN AMAL-  
gamator and Separator that has stood the  
test of about twenty years' practical working in  
the gold mines of California, and for nearly  
the same time in the silver mines of Nevada,  
having been introduced into the first steam  
mills built in the then Territory, since which  
time they have been successfully working  
against all competition.

The great advantages these Amalgamators  
have over any others, are—

1st. Much less Cost.

2d. They do not "flour" the mercury,  
and collect any that may have been "sick-  
ened" in the battery or grinders.

3d. The "sloshing" motion given to the  
pulp (by the revolution of the miller under  
the stationary frame) against the amal-  
gamated copper plates that are fastened to  
the frame, and by this means catching the  
fine gold and mercury that will not settle.

4th. The gate in the cone, through which  
the pulp is discharged, from the top, and  
where there is the least motion, almost  
precluding the possibility of any granulated  
mercury or fine gold escaping.

There are over 500 of them in use in Cali-  
fornia and Nevada, where those interested  
can see their practical workings.

**CELEBRATED UNION PAN!**

A fast Grider and thorough Amalgamator; has double  
Millers, Rolling Shoes and reverse action.  
Millmen and others are respectfully invited to examine  
this Pan, before purchasing others, as it gives the best satis-  
faction. Can be seen in operation, daily, at the San Fran-  
cisco Foundry, Fremont street, near Mission.  
Ores, in lots not exceeding 2,000 pounds, tested by  
22v13 G. W. STRONG, Assayer.

**NITRO GLYCERINE.**  
**Nobel's Patent Blasting Oil!**

WE ARE NOW PREPARED TO SELL NOBEL'S PAT-  
ent Nitro Glycerine. The same is stored with Mr.  
C. S. SWENSON, at Michigan Bluff, Placer county, from  
where the Oil has to be received by purchasers.  
Application to be made to Mr. C. S. Swenson, or to the  
undersigned.

**IGNITERS AND CARTRIDGES!**  
For sale at the same place.

Mr. Swenson is willing, if desired, to show purchasers  
the mode of blasting, either at his own mine, Michigan  
Bluff, or at the places of purchasers.

Pamphlets, with minute instructions, will be presented  
to every purchaser or applicant.

BANDMANN, NIELSON & CO.,  
210 Front street, San Francisco.

**FOR SALE!**  
**QUARTZ AND MINING MACHINERY**

ONE GARDNER'S THUNDERBOLT CRUSHER, LARGEST  
size and best quality; is entirely new, with all extra  
with a large lot of other Quartz Machinery, including En-  
gines, Boilers, etc.

**Rheumatism!!**  
**Still Another Witness!**

LATHROP, Cal., Sept. 19, 1866.  
(White Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years,  
been afflicted with Chronic and Inflammatory Rheumatism,  
and the sufferings and tortures I endured to consequence  
cannot be told. I have, at an expense of thousands of dol-  
lars, employed many physicians, both in this country and  
in Europe (where I was born and resided many years),  
among which were several eminent professors of medicine,  
and experienced no benefit from their treatment, more  
than attunes a slight and temporary relief.  
About two years ago I was induced by some persons who  
had been cured by it to use Richard's Remedy for Rheuma-  
tism. It is enough to say that I was almost immediately re-  
lieved, and that I have not suffered with it since. I keep  
the medicine on hand, and, on the first approach of any  
returning symptoms, I take a few doses, which invariably  
puts it to flight. I therefore cordially recommend it to the  
afflicted as an unfailing remedy for Rheumatism.

paper.—[Susan Courier.]

## THE UTILIZATION OF PEAT.

There is much reason to believe that peat is soon to be elevated from its original employment, as a fuel of the lowest order, to an important position, not only as a fuel, but also as a material for useful manufactures. Recent experiments with regard to its steam-making qualities, in a locomotive on a railroad in Connecticut, have quite astonished engineers, and have led to numerous other like experiments on different railroads. A most successful trial has been made on the line from Kingston to Montreal, in Canada, where a distance of 177 miles was made, at a rate of 25½ miles per hour, including stoppages, at a cost of forty-nine shillings; the same distance has heretofore averaged 120s. for coal, and 123½s. for wood!

The advantage of peat in the above trial is certainly most extraordinary, unless there is a greater relative difference there between the cost of peat and coal or wood, than is usually found elsewhere. Yet, in addition to the advantage of cost, a gain in time of fifty-two minutes is also included. This statement is communicated to the London "Mining Journal," on the authority of W. Austin, a civil engineer.

The Pittsburg "Manufacturers' Journal" states that the Grand Trunk Railroad is making extensive preparations to introduce it on that important line of travel. The correct working and manipulation of peat as a fuel is rapidly becoming understood, and practice will soon prove it to be a most invaluable substitute for coal and wood. In view of what has already been done, is it not worth the while of California capitalists and men of business to look into the matter, with the view of turning to profitable account the immense peat deposits of our own State; the more especially from the fact that we have none but very inferior coals on this coast.

It is not for steam fuel alone that peat has been found valuable. Encouraged by success in that direction, a most successful experiment has recently been made in employing it for iron smelting. The trial was made at McDougall's car-wheel factory, in Pittsburg. The material there used was "Hodge's peat." The cupola was charged with two layers of iron and anthracite coal. The third or topmost layer was iron and peat. The time was forty minutes less than with coal alone. The iron smelted by the peat was hotter when drawn off from the coals, and was said to be more compact and more like wrought iron than the other. The test was a severe one, the proportion being twelve of iron to one of peat. The proportion for coals being seven to one. Renewed experiments are to be made shortly.

The very latest, and perhaps the most unexpected effort of utilizing peat, comes to us from England, where Mr. T. G. Chilsin, of Hutton Garden, has invented a process for so treating peat by chemical and mechanical operations as to bring it into a condition in which it may be readily employed in the manufacture of various articles of ornament or usefulness, rigid or flexible—very much resembling, in that condition, prepared India-rubber and caoutchouc. The manner in which this is done is elsewhere described in the present issue, under the head of "Recent Inventions."

THE CALIFORNIA ACADEMY OF NATURAL SCIENCES has removed to 622 Clay street, north side, between Montgomery and Kearny. The regular annual meeting of the Academy occurs on Monday evening next, Jan. 7th. The rooms designed for the Cabinet and for meetings is 50 x 20 feet, and a reading and library room adjoining is 20 x 20.

ANY PERSON who may have a small amount of money, which they would like to venture, either as purchaser or partner in a new mining invention, will find an opportunity by reference to our advertising columns of to-day.

## HENDY'S CONCENTRATOR.

### Hendy's Improved Patent Self-Discharging Sulphurets PRATER CONCENTRATOR

Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.  
LOUISIANA MILL, near Conditville, Mariposa County.  
OPHIR MILL, near Newcastle, Placer County.  
C. H. SCHNABLER'S MILL, Doly Flat, Placer County.  
JERSEY BLUE, near Folsom, Cal.

SPRING HILL MILL, Amador, Amador County.  
GOLDEN GATE MILL, Volcano, Amador County.  
RAWHIDE MILL, Jamestown, Tuolumne County.  
TRIUNFO G. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State, also in Idaho, Arizona, Colorado and Mexico.

### Hendy's Latest Improved Concentrator, for Gold and Silver Ores, With Revolving Stirrers and Rotary Distributor.

By this improvement the conical feeding distributor has been entirely done away with. The feed in this machine is made to enter the conical hopper; from thence it passes through the hollow arm, leading to the T attachment, marked D, which is made to sweep slowly around the circumference of the pan, by means of the ratchet teeth upon the upper edge of the same, into which two pawls are seen to work. This motion is obtained from the vibrating action of the pan, as in common use. Upon the under side of the T attachment to the arm, are small openings or perforations, through which the pulp is dropped from the feeder into the pan. The constant revolution of this arm secures a more uniform feed than can be obtained from the conical feeder. A set of stirrers, with small projectors or teeth is shown, which is also kept in revolution with the feeding arm, the design of which is to prevent the sand from packing near the center, where the motion is diminishing. The discharge orifice and box for receiving the sulphurets will be readily distinguished at box C. These pans may be so connected, as in the cut, that two can be driven by one shaft and pulleys. These machines have been thoroughly tested, and pronounced a perfect success.

#### Certificates:

JOSHUA HENDY, Esq., Dear Sir: I have been using three of your Improved Concentrators for the past four months, at the Spring Hill Mill, and they give perfect satisfaction.  
Yours truly,  
WM. H. HOOPER.  
Two of these Improved Machines have been ordered by Mr. Hooper, for the Gold Hill Mill, at Grass Valley.

JAMES TOWN, TUOLUMNE COUNTY, CAL., July 15th, 1866.  
JOSHUA HENDY, Esq., San Francisco.—My DEAR SIR: It gives me pleasure to inform you that the four "Improved Self Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations. I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,  
R. P. JOHNSON, Superintendent Rawhide Mill Company.

This Machine can be seen at H. J. Booth & Co's, Union Foundry, First street, corner of Mission. For further particulars, send for a Circular. Address,

J. HENDY.

402 Montgomery Street, San Francisco.

N. B.—The proprietor is prepared to furnish these Machines on thirty days trial, to responsible parties.

## ANNUAL MEETING.

SAN FRANCISCO, Jan. 7, 1867.

Mr. Stearns in the Chair. Thirty members present. Minutes of previous meeting read and approved.

Dr. J. B. Trask was elected a life member, and Dr. C. D. Cleveland and George S. Whitney were elected resident members.

Governor R. C. McCormick, of Arizona, and R. C. Jacobs, of Chihuahua, Mexico, were nominated for corresponding members.

Messrs. A. T. Mason, A. Sutro, H. C. Bidwell, J. W. Kidwell, and H. P. Carlton were nominated for resident membership.

The various officers and curators submitted their reports for the past year.

The report of Mr. Hubbard, the Treasurer, showed the receipts for 1866 to have been about \$1,000, and the expenditures nearly the same, with outstanding dues to the amount of \$200.

The Librarian reported many valuable additions to the Library, by foreign exchanges and subscriptions.

The Curators of Botany and Paleontology also reported additions to the Academy's collection in their respective departments.

The Publication Committee submitted their report through the Chairman, Prof. Whitney—the publications of the Academy for the past year were double the number of pages printed the previous year (1865).

The Academy then proceeded to the election of officers for the ensuing year, and the following gentlemen were elected:

President—Professor J. D. Whitney.  
Vice Presidents—Leander Ransom and Robert E. C. Stearns.

Treasurer—Samuel Hubbard.  
Recording Secretary—T. C. Bradley.  
Corresponding Secretary—W. B. Ewer.  
Librarian—Dr. A. Kellogg.

Curators—Of Mineralogy, W. S. Keyes; of Botany, Prof. H. N. Bolander; of Paleontology, W. M. Gabb; of Zoology, Eugene F. Loring; of Conchology, W. G. W. Harford; of Entomology, Dr. H. Behr.

Committee on Finance—Prof. J. D. Whitney, Samuel Hubbard, R. E. C. Stearns, William Ashburner.

Committee on Proceedings—W. S. Keyes, Prof. H. N. Bolander, P. Bosqui.

Dr. Behr exhibited a sample of coloring matter obtained from an insect of the cypselids species—one of the branchiopods—which is found floating in great abundance, like a thick scum, on the surface of a lake in Marin county, and probably elsewhere in California. The color is a bright scarlet, insoluble in water, and unaffected by light or warmth, but soluble in alcohol and oil. The doctor thought it might prove valuable as a dye stuff, and said it could be obtained in large quantities. Adjourned.

## STEWART'S NEW GRINDER AND AMALGAMATOR.

Among the recent new and promising inventions we have now to mention Mr. J. H. Stewart's hinged muller plate grinder and amalgamator, which the inventor informs us is already being adopted into successful use.

Our artist has furnished the accompanying engraving, which well illustrates the machine in a small compass. Its bottom is perfectly flat. Fig. 1 represents the general appearance of the pan. The revolving muller plate, E, in a five-foot pan, is made only six inches wide and three inches thick. On the under side of the muller plate are twelve grooves, each six inches long, three inches wide and two and a half inches deep. Into these grooves are placed the hinges represented on the center of the grinding shoe,

conc being thin enables the steam to have a more direct effect in heating the pulp.

The inventor, who has had ten years' practical experience in quartz operations, says this pan will reduce ores cheaper and quicker than any other made. He claims the following among other advantages:

"1st. The muller plate being made small reduces the amount of power consumed in throwing the pulp, at least one-half.

"2d. The pulp has a much better opportunity to circulate and come fairly under the shoes, on account of the limited surface presented by the muller.

"3d. The shoes being attached by an adjustable hinge joint, midway of the shoes, the bottom wears down even with the dies also. This is an important accomplishment, attained in theory only by other pans, while this one does it in practice."

These pans are manufactured at the Miners' Foundry, First street, where Mr. Stewart's

STEWART'S NEW GRINDER AND AMALGAMATOR.

F, in Figs. 1 and 2. The groove being concave, and the hinge of the shoe convex, it is allowed to swing up and down, while it is rigidly held from swerving to the right or left. A small key, a, holds the shoe in place when the muller is raised. The shoes, F, are twelve in number, and are made fifteen and three-fourths inches in length by about twelve inches wide and two and a half inches thick at the outer edge, and one and a half inches thick at the heel or inner edge. The muller revolves from right to left, as you face the engraving. The upper part of the shoes project forward, so as to force the pulp down between the shoes and the dies. The flanges, D, are for the purpose of directing the pulp to the center. The lever, H, is used for the convenience of lifting the muller expeditiously from the dies whenever desirable.

The cone in the center is proportionally large, being two feet in diameter and eighteen inches high. This gives the space within the inner line of the grinding surface a larger radius than in most pans, obviating the cleaning up of a large portion of grinding surface, which, from its limited circle, is generally the least effective. The steam chest underneath the pan reaches from about the center of the shoes to the cone, which latter forms a part of the chest. The

art will take pleasure in showing miners and parties interested in machinery the chief principles of his invention, and furnishing further information.

EXERCISE.—Nothing is more invigorating to the constitution than judicious exercise of the muscles. The great cause of general debility, so prevalent among residents of crowded cities, is mainly due to a lack of proper exercise. The introduction of street cars has, doubtless, greatly added to complaints from this source, as thousands who were formerly in the habit of walking to and from their places of business, are now tempted, by cheap fare and convenient carriages, to ride; thereby neglecting one of the greatest promoters of health, in their accustomed walks. No person can enjoy health without exercise of some kind. Sedentary people who will ride, should accustom themselves to regular gymnastic exercise of some kind or other. All such in this city would do well to patronize the San Francisco Olympic Club.

THE PARIS EXPOSITION COMMITTEE.—A meeting of the California Committee in the Paris Exposition, will be held at their usual place of meeting 418 California street, at 3 o'clock P. M. to-day.

AUSTRALIAN GOLD—GREAT INCREASE OF YIELD.—The receipts of gold from Australia appear to be sensibly reviving. The receipts for September last were \$3,433,885, against \$1,192,780, for the corresponding period of the previous year. For the nine months ending with September 30th last, the value of the gold imported from Australia was \$23,196,855, as compared with \$10,776,160 in 1865, and \$12,108,310 in 1864. In this connection it may not be without interest to recapitulate the Australian yield of gold for the past eight years:

1858.....	\$45,323,815	1862.....	\$33,523,765
1859.....	48,122,830	1863.....	29,976,840
1860.....	33,595,000	1864.....	13,284,855
1861.....	31,658,125	1865.....	25,255,850

From present appearances, the total yield of 1866 will considerably exceed \$30,000,000; perhaps reach the yield of 1862—\$33,523,765. This large and unexpected increase for 1865 and 1866 is most remarkable in its occurrence, as well as important in its commercial import. We are not advised how or where this extraordinary increase is derived. The despondency which pervaded the public mind of Australia in 1864 is now happily removed, and the United Australian Colonies bid fair to again prove formidable rivals to California and its neighboring States and Territories in the yield of the precious metals.

CALIFORNIA OAKS FOR WINE CASKS.—Dr. G. B. Crane of St. Helena, Napa county, has made a nine thousand gallon cask from native oak grown on his place. We can assert on his authority, that as good oak for wine cask staves can be found in Napa Valley, as can be imported. Dr. Crane commenced his vineyard in 1859, and has made thirteen thousand gallons of wine this year.

A WRITER in the Times advises the concerted action of the public press in familiarizing the people of Nevada State with the necessity of changing their name to "Washoe." "To leave it to the Legislature," he says, "without such preparation, is to allow it to go by default." The name is not only a misnomer, the State not being particularly "snowy," but it leads to constant confusion in connection with the California county and city so named.

RED KEROSENE.—An article called "red kerosene" is being introduced into the Eastern market, under the specious pretence of its being an inexpensive product from petroleum. It is useless to say that it is merely a "dodge" of some oil speculator, by which to palm off a very inferior article at a higher price than a really better article of ordinary kerosene. The "red kerosene" is merely the ordinary article colored, for the purpose of carrying out the deception.

DIVIDENDS.—The following monthly dividends have been declared: Crown Point, \$100 per foot; Hale & Norcross, \$150 per share or \$100 per foot; Empire Mill and Mining Company, \$10 per share or \$160 per foot; and Imperial Silver Mining Company, \$8 per share. Crown Point carries over a balance of \$36,000 to next month.

## Communications.

IN THIS DEPARTMENT we invite the FREE discussion of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## The Mines of Central Nevada.

BY J. D. EMERSLEY.

EDITORS PRESS:—In previous communications I gave a slight description of Hot Creek and Reveille districts, situated respectively ninety and one hundred and thirty miles southeast of Austin. Now that a toll road has been so far completed as to be fit for ordinary travel, Pahrnatag is brought within 200 miles of Austin—about half its distance from Salt Lake City. As stations are being built every fifteen or twenty miles between Smoky Valley and the promising town of Bancroft, located at the lower end of Hot Creek Cañon, travelers can make the journey, even in winter, without much inconvenience. It will be of great advantage to the mining interests of Pahrnatag that a series of natural passes suitable for a good road have been found and tracked out, so that a trading depot has been brought within easy access, and it is no less beneficial to the Austin merchants, who will only be too happy to furnish the supplies which may be required in all of that section of country. The Messrs. Raymond are now in Austin, and give very encouraging accounts of the Pahrnatag mines. Some of their ledges have been sunk upon to the depth of forty or fifty feet, and though occasional breaks and pinches have been met with, the ore, as a general thing, has increased in quantity and richness, with an increase of depth. The formation of Pahrnatag is similar to that of Hot Creek and Reveille districts, comprising feldspathic granite and porphyry, quartzite and talcose slate, with a surface cap of hydrocalcite or sedimentary lime stone of varying thickness. This, also, is the formation of Enreka, Diamond and Newark districts, seventy miles east of Austin, in the Hot Creek range of mountains, where some very valuable mines are now being opened and a 20-stamp mill erected.

The district, also, to which my present letter shall mainly relate, is similar in formation; so that the theory of certain wisemen, as to the unreliability of silver mines found in limestone, is practically disposed of.

The successful developments recently made in the limestone portion of Cortez district, are equally conclusive on this point, notwithstanding the fact, that a year ago, one of those mining soothsayers, who can see into the bowels of the earth, and foretell the future of a mine, if paid for it, declared that the district had not a single ledge which promised to become a valuable mine. Like a certain clothes-horse Colonel amongst us, who, having Silver Bend on the brain, when recently visiting Silver Creek and Reveille, could behold nothing but "bilks" and "wild cats," and was far-seeing enough to discover that mines were of little value before he had come within two miles of the mountains on which they were located. We rely on common sense and sound mining experience for an accurate estimate of the value of our mines in South Eastern Nevada, rather than upon the opinions of any mining experts whatsoever.

## DANVILLE DISTRICT.

In the second chain of mountains, east of the Toiyabe range, and about seventy miles southeast of Austin, is located the district of this name. It was discovered in July last by a party of prospectors, who, returning from a trip still farther to the east, were, in consequence of being short of provisions, making, as they supposed, a bee line for the nearest settlements. It is located on the eastern slope of the mountains, plentifully supplied with wood and water, and has within easy reach a large breadth of grass and agricultural land. The formation is feldspathic porphyry, silicious slate, quartzite and granite, capped by limestone, leaving an imperfect crystallization. The belt is little more than half a mile in width, with apparently five or six distinct veins running through it, on nearly a north and south course.

As far as can be ascertained, without work being done on the ledges, they seem to dip west at the surface, though probably they will pitch east, when the breaks likely to be encountered have been passed, in the sinking operations. The mineral is generally well diffused through the quartz, and the ore of the district, as a whole, is of a high grade, very little of it being of less value than \$100 per ton. Of the first discoveries, the Vanderbilt ledge is considered of greatest promise. This is about  $3\frac{1}{2}$  feet wide, and the ore is so uniform in quality, that it is needless to attempt to assort it. Two lots have been brought to Austin to be worked, as a test—one sample gave a pulp assay of over \$300 per ton, and the other over \$170. As it costs fifty dollars to haul the rock, and forty-five dollars to work it, the owners are disposed to wait till a mill is built in the district before they have any more of it milled. The Vanderbilt series of ledges consist of several parallel veins, all showing good mineral, and is, undoubtedly, a very valuable property. Another series, also of great value, includes the Vestal, Europa, California and Great Eastern. The ore in these ledges is an antimonic sulphuret, somewhat different in appearance from that of the Vanderbilt series, but probably superior to it in milling quality. Only a small amount of work has been done in the district, the deepest incline being little more than fifteen feet; but enough has been accomplished to prove that it contains quite a number of reliable mines, which, by means of well applied capital, will one day give a steady and highly profitable yield of silver bullion.

## WORKING TESTS.

Since I gave a description of Reveille district, two batches of its ore have been brought to Austin, and worked with most encouraging results. About 1,500 pounds from the Fisherman ledge gave a pulp assay of \$1,617 per ton, and another lot from the Crescent, intended to give a fair working test of the whole of a very wide ledge, yielded \$230 per ton.

## FOSSILIFEROUS DEVELOPMENTS.

It is also interesting to know that the fossils recently submitted to the California Academy of Natural Sciences, by Doctor Blatchley, and pronounced to belong to the lower silurian formation, came from the mining belt of Hot Creek district. If great age in a formation carrying veins of the precious metal is a desideratum, we certainly have it, with all its advantages, not only in the district named, but also in others, which exactly correspond with it in their geological features.

Austin, Nevada, Dec. 24, 1866.

(Written for the Mining and Scientific Press.)

## The American Silkworm.

MESSRS. EDITORS:—Over a year ago Prof. Verrill, of Yale College, published a short notice in the American Journal of Science, of a new American silkworm. This was copied into some of the California papers; but your readers may desire to know more about it.

The insect in question, the *Attacus Polyphemus* (Linn.) is a large and showy butterfly, the worm of which feeds on the leaves of several of our forest trees, especially of the maple, oak and willow. In their wild state they are not abundant at any one place; yet are not rare, and occur from Canada, throughout the Northern States, even to the Gulf of Mexico.

After numerous experiments and much patient labor, Mr. L. Trouvelot, of Medford, Mass., succeeded last year in successfully raising them in large numbers. From a few individuals, first caught, he increased his stock from year to year, until last year he had several wagon loads of cocoons. His method was to enclose the dense growth of scrub oak of those hills in netting, to protect the worms from birds; but this had the disadvantage that very many of the insects wound their cocoons in the dead leaves and dirt upon the ground, making the labor of collecting great. Moreover, a fire in the woods destroyed a considerable portion. He has since resorted to feeding, as with the common silkworm.

The cocoons are large, of a brown color, and generally rolled within a leaf. By a process of unwinding devised by Mr. Trouvelot, each cocoon yields about 1,500 yards, and 1,200 cocoons will make a pound of silk, which possesses great lustre and strength, and is pronounced by judges to be superior to all other silks manufactured, except the best Chinese. The quality and lustre is influenced, however, by the food. Just as he

seemed ready to realize handsomely for his labors, he has lately met with still another unlucky accident. On a recent visit to Massachusetts, I learned that he had lost most of his stock. This year he imported eggs of the Japanese silkworms, to compare the results of their culture with that of the natives. Upon these foreign insects, the disease which has proved so destructive to the silk interest in Europe, became developed, and after a time spread to the natives and destroyed them also. This disease is caused by a parasite fungus attacking the growing worm, and it is somewhat remarkable that it should have spread, as the American worms are not only very hardy, but are an entirely different species.

With most praiseworthy perseverance, Mr. T. proposes to begin anew again, and we trust he may succeed. He is an old practical silk grower from France, and has confidence in his ultimate success. Should it prove successful, there are large tracts in California, now valueless, that might be devoted to this interest. In the northern part of the State, especially in Shasta and Siskiyou counties, great areas of the mountain sides are covered with a low species of oak, that may ultimately be thus utilized; hence, we await with interest the success or failure of the enterprise here. Yours truly,

WM. H. BREWER.

YALE COLLEGE, NEW HAVEN, CONN., Nov. 30, 1866.

## PROCESS OF ROASTING ORES, ETC.

Translated from the German of F. Plattner, for the Mining and Gas-Light Journal, New York.

BY J. H. TIEMANN, M. E.

## NUMBER SIX.

10. Molybdanglanz (sulphuret of Molybdenum)  $\text{MoS}_2$ , by admission of air heated to a red heat and kept at this temperature, decomposes to sulphurous acid, which passes off as a gas and molybdic acid, which, provided the temperature was not high enough to smelt it, remain behind in needle-shaped crystals. These crystals, while hot, have a yellow color; but upon cooling are white; the single crystals are translucent. At too high a temperature, for which a bright red only is necessary, the acid smelts to a yellowish-brown liquid, and and evaporates more or less completely, as a white vapor. As a molybdic acid readily yields a part of its oxygen to reducing gases, when the temperature in roasting has been only a trifle too high, and the gases allowed to act on the substance, the oxyd only remains which is not volatile, and has a brownish color.

11. Glaserz (Silverglance)  $\text{Ag}_2\text{S}$  in the form of filings, or made artificially, in the form of a powder, when exposed on a clay saucer in an open muffel, to a heat not sufficient to cause it to sinter, much less to smelt, decomposes with evolution of sulphurous acid to metallic silver, having a dead (matt) appearance, and the particles not adhering together, it may be pulverized in an agate mortar, and has then a metallic luster. When the sulphuret of silver is in combination with such sulphurets, in small quantities, which have the property, when roasted in a reverberatory furnace, of forming sulphates which are decomposed at a higher temperature, and in such a manner that a part of the sulphuric acid escapes undecomposed, as in the sulphates of copper and zinc, it apparently acts upon the metallic silver formed, converting it into a sulphate of silver. (This will be again referred to further on.)

12. Arsenkies (Arsenical Pyrites)  $\text{FeS}_2 + \text{FeAs}$  when heated in the form of a powder, and the air admitted, gives off fumes of sulphuret of arsenic before it begins to glow; when it glows, which soon occurs on account of the oxydation, sulphurous and arsenious acids are generated; if the ore is stirred it glows brightly, increases in volume, and is apparently converted into sesquioxyd of iron, which, upon cooling, assumes a red color. When this product, however, is examined chemically, it is found to contain traces of sulphate and arseniate of iron; when exposed to a higher temperature, the sulphate only (vide pyrites and magnetic pyrites) is reduced to an oxyd, the arseniate remaining unchanged.

13. Arseucien Arseniate of Iron  $\text{Fe}^4\text{As}^3$  and  $\text{FeAs}$  at a dark red heat when pulverized and air admitted, soon begins to give off fumes of arsenic, glows gradually, becomes spongy, evolves a great deal of arsenious acid, and generally, in consequence of the presence of arsenical pyrites, some sulphurous acid. If the mass be allowed to cool after all the arsenious acid has been given off, it assumes a dark red color, and consists of oxyd of iron, with a large amount of arseniate of iron.

14. Kupfernickel (Copper Nickel)  $\text{Ni}^2\text{As}$  when exposed to a dark red heat on a clay saucer in an open muffel, changes to a voluminous delicate powder of basic arseniate of nickel, which, upon

cooling, has a yellowish-green color, arsenious acid and suboxyd of arsenic.

15. Spiekskobalt (Arsenical Cobalt and Nickel)  $(\text{Co Ni})\text{As}_2$  when finely pulverized and exposed on a clay saucer in an open muffel, to a gradually increasing red heat, is converted into basic arseniate acid and suboxyd of arsenic; when cool it has a reddish or yellowish green color, depending upon the quantity of nickel in the mixture.

16. Galena and metallic arsenic in equal quantities, (in the place of galena and sulphide of arsenic, which is sometimes roasted in the large way,) when intimately mixed and exposed to a dark red heat in the muffel, gives off sulphurous and arsenious acids, and not a small quantity of suboxyd of arsenic, and is converted into a black looking coherent mass, which is easily reduced to a powder. This mass, when cold, has a dark yellowish-gray color, and consists of arseniate and sulphate of lead. If a portion of this powder be heated to redness in a glass tube, open at both ends, it smelts and appears of a dark yellow on the edges, but upon cooling becomes opalescent and translucent.

17. Lichtes Rothgiltigertz (light Ruby Silver)  $3\text{AgS}, \text{AsS}_3$  in a powder, when gradually heated to a red heat in the open muffel, and stirred from time to time, is converted into a spongy, and partly granular mass, evolving at the same time sulphurous and arsenious acid and suboxyd of arsenic; on cooling the mass becomes brown, having metallic silver interspersed through it, in the shape of fine hairs. At a still higher temperature the mass remains unchanged, and consists principally of arseniate of silver. If, however, during the roasting, the ore be rubbed in an iron mortar from time to time, so that the parts which have become caked are thoroughly mixed with the partially roasted parts, no metallic silver is separated, the whole of the silver is converted into an arseniate, and at a higher temperature remains apparently unchanged.

18. Dunkles Rothgiltig (dark Ruby Silver)  $3\text{AgS}, \text{ShS}_3$  when roasted under the same conditions as No. 17, is converted into a caked mass, evolving at the same time sulphurous acid and tetroxyd of antimony (antimony acid,) which when cool has a brownish-gray color, and contains separated silver in fine hairs. If a part of this mass be rubbed up in an agate mortar and heated to a glow in an open glass tube, a small quantity of sulphurous and antimony acids are again driven off; the mass, when cool, has a light-brown or yellowish-gray color, and is free from metallic silver; at a middling red heat the mass remains unchanged, passing into metallic silver at a high temperature, and evolving white fumes of tetroxyd of antimony.

19. Fablerz (Gray Copper)  $4(\text{Cu}^2\text{S}, \text{FeS}, \text{ZnS})\text{SbS}_3$  when powdered and exposed to a dark red heat in an open muffel, evolves sulphurous and antimony acids before it comes to a glow; as the oxydation of the different parts increases it glows of itself, accompanied by a brisk evolution of sulphurous and antimony acids, showing a great inclination to sinter. If the caked ore be rubbed in a mortar, and again exposed to the heat, the appearance of fumes of antimony acid last but a short time, while the strong smell of sulphurous acid still continues. By continued roasting, and after being once or twice pulverized in the mortar, the ore loses the inclination to sinter, and the smell of sulphurous acid disappears, and on cooling it has a very dark yellowish-green color. If the roasted ore be treated with hydrochloric acid, a green solution is formed, in which may be detected the oxyds of copper, iron and zinc and sulphuric acid; and there remains a pale, reddish-yellow powder, which, when washed, dried and ignited, assumes a light yellowish-brown color, being about one-third of the roasted ore, consisting of oxyd of copper and antimony acid, apparently antimoniate of copper.

20. Galena  $\text{PbS}$  and Antimonglanz (Sulphide of Antimony)  $\text{ShS}_3$  thoroughly mixed in powder, when exposed to a dark red heat in the muffel, evolves sulphurous and antimony acids, and without sintering, is converted into a yellowish-gray mass, which appears to consist principally of antimoniate of lead, which, when examined chemically, however, is found to contain sulphuric acid as well.

[To be Continued.]

CEMENT FOR ROOFS.—M. Sorel of Paris uses a coating for walls which is said to be superior to pure gypsum. The oxyd of zinc is mixed with size, made up like a wash, and applied to a wall, ceiling, or wainscot. Afterward the chloride of zinc, made into a wash in the same way, is applied. The oxyd and chloride immediately combine and form a kind of cement, smooth and polished as glass, and possessing the advantages of oil paint, yet without any objectionable smell.

## Mechanical.

## Bridging Great Rivers.

The increase and concentration of travel, brought about by railroads, seems to have induced quite a passion—perhaps only a necessity—for bridging great rivers. It is only within a few years that the first project of bridging the Mississippi, or any of its larger tributaries, has been at all considered a matter of special need, or even thought feasible. The first bridge over the Ohio was completed only about a year ago at Steubenville. The second has just been completed at Cincinnati at a cost of \$1,750,000. A third is now in course of construction at Parkersburg, to connect the West Virginia and the Marietta and Cincinnati railroads; still another to connect the Baltimore and Ohio and Central Ohio railways, is urgently called for; while a fifth is projected at Louisville. In addition to those built and projected over the Ohio, its largest tributary, even the "Father of Waters" itself, will, in all probability, soon be spanned at Dubuque, Galena and Quincy, and very likely even as low down as St. Louis. Work has already been commenced on the one at Quincy. Verily, we live in a fast age, when people cannot wait to be ferried over even the largest streams; but must travel over them with railroad speed, at whatever cost or hazard. That this passion for bridging great streams is not altogether confined to the Yankees, is testified by the structures already completed over the Niagara, the St. Lawrence, and the Menai Straits in England.

But, perhaps, the most astonishing architectural effort of this description, is the bridge now in process of construction for the Imperial Mexican railway, between Vera Cruz and the city of Mexico. This structure is more properly a viaduct, and when completed, will span the Barrauca de Metlac, at the enormous height of *three hundred and eighty feet*, being nearly one hundred and fifty feet higher than any such structure ever before undertaken. Perhaps the best idea of this astonishing height may be obtained from the reflection that were it possible to place Bunker Hill Monument upon the top of the cupola of the Boston State House, their united elevation would scarcely touch the roadway stretched upon the magnificent arches of this wonderful structure. This bridge has been designed by French engineers, but being built of iron, in sections, in England, from whence it will be transported to Vera Cruz, and placed in position as soon as the rails have been laid down to that point.

**PURITY OF METALS.**—Many persons labor under the wrong impression that chemical purity is an essential condition for strength in metals. Gold has to be alloyed with copper and silver to make it more adapted for the arts and commerce. Zinc, when quite pure, cannot be rolled into sheets, but when mixed with a small percentage of lead, it becomes very ductile. The presence of lead prevents it from assuming a crystalline structure. The characteristic sign of purity is the power of crystallization; the purer the metal, the less its cohesive strength.

**COLD AND HOT-BLAST IRON.**—The relative power of these two descriptions of iron for resisting impact, is as follows: The mean ratio of strength in cold-blast iron being 1,000, hot-blast iron is represented by 1,024; and the main ratio of power to sustain impact being in cold-blast as 1,000, it was 1,226 in hot-blast iron. These were the results of an inquiry established by the British Association.

**A STEAM CARRIAGE** for towing boats and barges on rivers and canals, has recently been introduced in France, on the river Olse, and was found to answer perfectly. Running on the towing paths, it makes ascents and descents, and is said to turn as easily as a horse.

## Interesting Experiments with the Famous "Harrison" Boiler.

On Saturday, November 17th, a committee of scientific gentlemen, connected with the Franklin Institute, paid a visit to the Steam Boiler Works of Joseph Harrison, Jr., situated on Gray's Ferry road, near the U. S. Arsenal, Philadelphia, for the purpose of witnessing some interesting experiments with the celebrated boiler that is manufactured at those works, which experiments are described as follows in the *American Artisan*:

These experiments were part of a series under investigation at present, and they were enhanced in interest from the fact that the boiler operated on was heated nearly red-hot, and cold water was then immediately forced into it, which action, with ordinary boilers, would produce instant explosion, but, on the occasion mentioned, was done with perfect safety, and without the slightest injury to the boiler.

When these experiments commenced, the boiler had steam up, and it was blowing off violently, with a pressure of one hundred pounds to the square inch; the blow-off cock attached to the boiler was then opened wide, blowing all the contents out in the space of two minutes. After all the water and steam had escaped, and the pressure had fallen to zero, the blow-off cock was closed and the pump started, injecting cold water into the now greatly-heated boiler, for the fires were burning very brightly under the same.

As soon as the cold water began to enter the heated boiler the steam gradually rose until the water was thought to reach the top of the bridge wall, when, coming in contact with the still more highly-heated portion of the boiler, the pressure rose to 100 pounds almost instantly, at which time the safety-valve began blowing off violently.

As the water rose, and had nearly reached the gauge-cock, a joint opened in the boiler, permitting a free escape of water. This leak stopped itself in less than one minute, and two other leaks in succession started and closed as in the first case, and when the water had reached the second gauge-cock, the boiler was perfectly tight, with steam blowing off at 110 pounds at the safety-valve; the fires being very bright and active, and all the conditions such as would indicate a good boiler in perfect running order were apparent.

The entire experiment occupied seventeen minutes' time, and gave the greatest satisfaction. This was the third trial of the same boiler under similar circumstances, and its result indicates a new era in the construction of steam boilers.

**TWIST DRILLS.**—The use of twist drills in place of flat bids fair to become general. They cut more easily, and with greater accuracy. The flat drill will not always bore a hole which is perfectly cylindrical. The *American Artisan* suggests the adoption of the decimal system in the sizing of drills—that is, that they be made to increase by tenths and hundredths of an inch, instead of eighths, sixteenths, etc.

**TEST FOR STEEL RAILS.**—In the steel rail mills, at the "Cyclops" Steel Works, Sheffield, a mass of iron, weighing one ton, is dropped from a height of 36½ feet upon the middle of the rail, placed upon three-foot supports, as a test of its strength. The rails rarely break, but occasionally bend, under this tremendous trial.

**STEEL RAILS IN BOSTON.**—The Boston Traveller learns that the Boston and Providence Railroad have lately laid three or four miles of steel rails on their road beyond Roxbury, and the officers think they are a great improvement on iron rails.

**COST OF RAILWAYS.**—The proportionate cost of railways, in round numbers, taking the United States as 1, is Germany 2, France 3, and England 4.

**CANDLES.**—The first improvement in the material used for candles dates as far back as 1799, when a person named Wm. Bolts took out a patent, by which he proposed to squeeze the tallow after melting, and while in the act of cooling from the melted state.

**WHAT THEY ARE.**—Agriculture and manufactures are the building materials, the mortar and stone used by intelligence to shelter a nation's wealth and prosperity.

An English patent has been taken out for a process of manufacturing picture-frames, moldings, furniture decorations, fronts for stores, etc., from compressed peat.

## Scientific Miscellany.

**PREPARATION OF OXYGEN.**—A new process has been patented in France for obtaining a supply of oxygen gas from common air by means of highly oxygenated compounds, such as chromates and bi-chromates, manganates and per-manganates, which, if deprived of a portion of their oxygen by means of steam, have the power of absorbing oxygen again when exposed to a current of dry, heated air. The improvement consists in making the action continuous, by placing in a retort one of the compounds mentioned, and passing into the retort a current of steam. A current of oxygen is carried off and collected in a gas-holder, while the steam is condensed to water. When oxygen has ceased to be eliminated, a current of dry, heated air is forced into the retort. The compound absorbs a portion of oxygen, and is again ready for the action of steam. Thus by the alternate action of air and steam, the same compound produces oxygen for an unlimited period. The process is said to work with great regularity, and may yet be of considerable importance in metallurgy.—*Exchange.*

We have little faith in the probability of an utilization of the above process to any extent; but if some means could be devised by which the oxygen of the air could be so readily and cheaply separated from its nitrogen as to be made available upon a large scale—for supporting combustion, for instance—we might then, indeed, look for a revolution in metallurgy, and, in fact, in almost every industrial pursuit. The perplexing question which is now agitating the English public, as to what shall be done when their coal gives out, would then be practically answered.

An ordinary blast-furnace making white iron requires nearly 7,500 cubic feet of air per minute, or, in other words, it consumes about *fourteen tons* of atmosphere every hour. In consuming this fourteen tons of atmosphere, the coal employed must raise from the ordinary atmospheric temperature to about 5,000 degrees of heat, *ten tons* of nitrogen, which is perfectly useless to the smelter, except as a medium through which he obtains his oxygen. Now, if some plan could be devised by which the *four tons* of oxygen could be separated from their ten tons of nitrogen, and thus applied direct to the furnace, charged with the proper quantity of coal, we should then have a degree of heat in ordinary furnace operations surpassed only by that obtained by the compound blow-pipe, and at a trifling amount of cost, apart from that of the separation of the oxygen from its nitrogen. The time occupied in the various processes of smelting, for instance, would also be reduced to that of a mere fraction of that now required.

**THE MANUFACTURE OF IRON WITH ANTHRACITE,** is attracting considerable attention in England at the present time. There has heretofore been much prejudice against its use there; but it is now stated that Mr. Samuel Blackwell, of South Wales, has devised a furnace for its use, which combines more economy and efficiency than any furnace heretofore employed in Pennsylvania or elsewhere. After several weeks' trial with his new furnace, he reports the production of one ton of iron to each 18 ewt. of coal. This, we believe, is the greatest economy which has yet been obtained in producing iron with anthracite fuel. Anthracite iron is particularly desirable, from the fact that it is said to possess properties which render it peculiarly valuable for being converted into steel.

**OZONE.**—Mr. G. Plante, in a note to the French Academy, states that fifty per cent. more ozone is produced in the electrolysis of water, when the poles are of lead, than when they are made of platinum. He conjectures the increase is the result of the secondary action of a layer of oxyd on the electrode.

**RELEUDINE.**—Hesse has discovered a new alkaloid in the red poppy; it is also found in good opium. It is soluble in water, alcohol and ether, and crystallizes from the last in white prisms.

**NATIVE LEAD ASSOCIATED WITH GOLD.** Some interesting discoveries of native lead, associated with gold and oxyd of iron, are said to have recently been made in the gold-bearing drift found under the basalt, in Victoria, Australia. It is also met with in the neighboring galena-bearing veins. Specimens are found in nearly all the "wash-dirt" about Mount Greenock and at Aorea. A large number of these specimens have been sent to London, where they are exciting much interest. A paper, upon this occurrence, will be presented at the next meeting of the Geological Society. Native copper, accompanied with gold and silver, is found in the copper mines of Butte county, in this State; but we are not aware that lead has been found associated with gold anywhere on the Pacific coast.

**OSMOTIC PROCESS FOR SEPARATING SUGAR.** A method of separating the beet sugar from the molasses has been recently adopted in France, which is based upon the principle of *osmose*. This word is the one used to express the tendency exhibited by liquids of different densities to seek each other through the pores of a separating membrane. The flow is generally from the least to the most dense, and is in fact a form of capillary attraction, the pores of the membrane being in reality tubes, of a length equal to the thickness of the membrane. In the case under notice, the membrane used is paper parchment. Water is passed upward, and the molasses downward, on opposite sides of the membrane.

**COPPER SMOKE.**—It is reported that the Messrs. Vivcan & Sons still continue to be eminently successful in the application of their new arrangement for the combustion of the sulphur sublimed from copper ores, and its utilization by conversion into sulphuric acid. The saving in the manufacture of copper, by the production of a valuable merchantable commodity from a hitherto wasted material, is very great; to say nothing of the great nuisance of "copper smoke," which works such destruction in the immediate neighborhood of copper works which do not consume their smoke.

**THE HARDNESS OF SILVER.**—M. Mathey, assayer at Locia, has shown that the hardness of which carvers in silver sometimes complain is not owing to the presence of tin, lead, or any other metal, but is solely due to the high temperature at which the silver is cast. By letting the crucible cool, until a slight solid crust is formed on the surface of the fused metal, and casting at that moment, a soft silver with a brilliant cut is obtained.

**SILICA IN CORN-STALKS.**—M. Pierre, in a memoir to the French Academy of Sciences, says some people have supposed that corn becomes laid because of the weakness of the stalk from the absence of silica, but chemical analysis does not show a deficiency of silica. Observing that corn on poor land was rarely laid, he concludes that the stalks in general give way in consequence of an over-development of leaves.

**A NEW TEST FOR IODINE.**—M. Cury Lea, of Philadelphia, has successfully used chromates in bringing about the starch reaction in the presence of iodine in extremely small quantities. For instance, in a solution of iodide of potassium, so dilute that the addition of nitric acid or starch produces no perceptible effect, by the further addition of a single drop of a dilute solution of the bi-chromate of potash, instantly produces the well known change of color.

**FINE COLORING MATTERS,** soluble in fatty matters, paraffine and similar hydrocarbons, and capable, by mixture, of producing any number of intermediate shades, have been discovered in the form of metallic soaps. They are obtained by precipitating various metallic solutions with soda soap. In this way the salts of iron afford a brown orange stearate; those of copper, a malachite green; those of nickel, an emerald green; those of chromium, a green which changes to violet; those of uranium, a bright yellow; those of cobalt, a lilac; and those of manganese, a rose red.

## NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**NOVEL GRATE BAR ARRANGEMENTS.**—The Messrs. Vicar, of England, have recently invented a furnace improvement, wherein a backward and forward motion is given to the grate bars. By this motion, a progressive movement is given to the fuel, from the front to the back or bridge of the furnace. This is effected by moving the bars in a mass towards the bridge, and bringing them back again. The bars have a travel of about three inches per stroke, and make a stroke in about four minutes, which causes the fuel to travel about three feet per hour. The rate of travel is adapted to the work to be done. When the furnace is very wide, instead of moving the bars forward together, they move each side of the furnace or half the bars alternately. The action of the furnace is the same as Jukes', but obtained by much simpler means, rendering it applicable to any class of boiler, whether fired internally or externally, as, instead of the endless chain used in Jukes', there is only a plain bar within the furnace. The mechanism, too, for imparting motion is of a very simple kind, and is not exposed to any heat that can injure it.

## PATENTS RECENTLY ISSUED.

**VACUUM VENTILATOR.**—J. W. Foard, San Francisco, Cal.: I claim an apparatus for raising fluid, gaseous or liquid, by means of natural or artificial currents of air, composed of horizontal tubes or pipes, which are supported by means of a collar, upon a vertical pipe, so as to be free to revolve thereon, and which are guided and maintained in proper position by means of a supplementary pipe, that extends from the first mentioned pipe, into said vertical pipe, substantially as described.

**PATENT SAFETY SHOE.**—J. Wyatt Reid of New York, has recently taken out a patent for a "safety shoe," in connection with car brakes. This shoe consists simply of a short bar of iron attached to the brakes, and reaching to within an inch of the rail. Its action is such that in case a man should fall before the wheel of the car, he is pushed aside, either between or outside the rails, and cannot by any possibility be run over. It is one of those "happy thoughts," which are at the same time so simple, that we always wonder that it has never been thought of before.

**FIRE-PROOF FELT FOR ROOFING AND OTHER PURPOSES.**—Moses A. Johnson, Lowell, Mass.: I claim a felted fabric of hair or other material, covered on one or both of its sides with paper and with silicate of soda or soluble glass, and whether painted or otherwise, rendered water-proof or not, as herein described.

**MAKING BUTTER FROM CHEESE-WHEY.**—Homer C. Markham and Charles G. Riggs, West Furen, N. Y., claims the separation of cream or butter from wheys by the means of heat and in the use of an acid liquid, substantially as described.

**WELDING OF IRON AND STEEL.**—John P. Price, Philadelphia, Pa., claims the welding of iron or steel by the aid of kryolite, as set forth.

[Kryolite is a mineral of a semi-vitreous appearance, varying from a glassy to a grayish white. It is a fluorid of sodium and aluminum, fusible in the flame of a candle. Its composition is as follows: Aluminum, 13.0; sodium, 32.8; fluorine, 54.2.]

**CHINESE QUARTZ MINERS.**—"Dan de Quille," in a letter from Downieville to the Virginia Enterprise, thus discourseth of the Gold Valley Quartz Mill: "The company go it strong on cheap plans and Chinamen. They have a Chinaman feeding the batteries, two Chinamen in the mine, a Chinese cook, and I don't know how many other Chinese employees. \* \* I would like to be superintendent of that mine awhile. There would soon be seen a train of Chinamen winding down toward the foot-hills."

**WARM.**—In the 900-foot level of the Belcher mine, says the Cold Hill News, it is no unusual thing to see the perspiration running out of the miners' boots. It is so warm and oppressive that men can work but a few minutes at a time without resting. This is the deepest work on the Comstock ledge, and air is supplied by machinery.

## WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING, }  
January 12, 1867.

## CITY STOCKS.

Spring Valley Water was active during the past week, a large amount selling at 61 @ 60%. San Francisco sold at 65 @ 64%, and California Steam Navigation at 63 1/2 @ 65 1/2 % cent. Most of the local insurance companies have already announced their dividends for the quarter closing with December—Pacific, 6 % cent.; Occidental, 4 1/2, Union, 6; National, 3; and Fireman's Fund, 4 1/2. The stockholders of the Pacific Insurance Company will assemble on the 11th of February, to consider the proposition to increase the capital stock from \$750,000 to \$1,000,000, and the shares from 7,500 to 10,000.

## MINING SHARE MARKET.

The share market has been characterized by a good degree of activity during the past week, influenced, to some extent, by the dividends disbursed and yet to be paid by the several companies. It will be noticed that some of the claims exhibit large gains in the bullion returns over previous receipts, with promising indications of a continuance; however, the yield of the Comstock Lode during the year 1866 is estimated at \$500,000 less than in 1865—say \$14,500,000. The total yield of this great vein, from the time operations were first commenced to the close of 1866, is placed at over \$60,000,000.

We present below a very interesting tabular statement relative to the product of bullion and dividends paid by the most prominent mines on the Comstock Lode during the year 1866, together with all the assessments levied during the same period by the various companies, of which public announcement had been made:

COMPANY.	Bullion Product.	Dividends.	Assessments.
Alpha .....	.....	.....	\$144,559
Bacon & Co. ....	.....	.....	15,000
Baltimore American .....	.....	.....	13,000
Belcher .....	.....	.....	143,520
Bullion .....	\$848,750	.....	175,000
Chollar .....	303,931	.....	.....
Confidence .....	.....	.....	78,000
Crown Point .....	1,313,357	\$234,000	.....
Danely .....	.....	.....	26,000
Empire Mill & W. Co. ....	456,775	32,400	.....
Eschschuer .....	.....	.....	32,000
Gould & Curry .....	1,605,228	232,000	.....
Hale & Norcross .....	1,189,768	324,000	.....
Imperial .....	910,187	175,000	.....
Lady Bryan .....	.....	.....	15,000
Ophir .....	450,000	.....	184,800
Overman .....	27,933	.....	25,000
Savage .....	1,835,800	267,000	.....
Sierra Nevada .....	.....	.....	55,510
Yellow Jacket .....	2,310,000	300,000	180,000
Totals .....	\$11,261,741	\$1,794,400	\$1,272,780

**HALE & NORCROSS**—still continues out of the market; \$2,800 has been bid and \$3,500 asked. This claim is in a very flourishing condition. From the 65 per cent. assay value of 2,765 tons of ore obtained from the mills during the month of December last the yield was \$144,348.35 in bullion. At a meeting of the Board of Trustees held on the 9th inst., a dividend of \$100 per foot was declared out of the net earnings in December. At the same session, the following preamble and resolution were passed: "Whereas, a tunnel has been projected, the object of which is to strike the Comstock Lode, in the State of Nevada, at a depth of 1,800 or 2,000 feet below the surface, for the purpose of draining said lode, and to furnish better facilities to the companies located thereon to work their respective claims; Resolved, that authority is hereby granted to the Board of Trustees of the Hale & Norcross Company to subscribe or advance such sum or sums of money, not to exceed in the aggregate the sum of \$100,000 towards the completion of said tunnel, as in their judgment they may deem best for the interests of this company."

**SAVAGE**—sold to a limited extent during the past week at \$2,140 @ 2,100, then at \$1,950, seller 30 (ex-dividend) closing at \$1,960 s 60. During the month of December the bullion returns amounted to \$214,847.39, and out of the net earnings during the same period, a dividend of \$100 per foot was paid to the stockholders on the 9th inst. This company carried forward at the close of December 5,100 tons of ore valued at \$180,468.79. For the week ending the 5th inst., the approximate value of 720 tons of ore extracted from the mine, aggregated \$26,961—equal to \$37.44 per ton. The largest amount—270 tons—came from the two stations in the Curtis shaft. Work had been suspended for four days during the week under review, on account of the impossibility to carry the ore away from the dumps. The body of ore between the 4th and 5th stations, discovered about a month

ago, promises to yield a considerable amount of first-class ore. The drifts from the Curtis shaft and from the old shaft, on the 7th station, have been connected; however, nothing has been done towards extracting ore in any quantity from this station. The north winze on the 7th station is down thirty feet, and it is said in good ore. Water has been somewhat troublesome at this point. The south winze is fifty feet in depth, and at thirty feet ore was reached, which now extends over the whole winze.

**CROWN POINT**—advanced materially under the favorable bullion returns for December, opening at \$1,250, steadily improving to \$1,400, seller 30, and at the close sold at \$1,400. This company received in bullion during the month of December \$184,854, an average of about \$45 per ton; in November, \$91,326. They pay a dividend of \$100 per foot on the 15th inst., leaving a surplus in the treasury of \$36,000. During the week ending January 4th, 1,087 tons of ore were taken from the mine.

**YELLOW JACKET**—exhibited considerable activity, selling early in the week at \$1,350, receding to \$1,225, rallying to \$1,280, and closing at \$1,330. We estimate the yield of bullion in December to be about \$160,000; previous month, \$202,000. A dividend of \$50 per foot will be disbursed to shareholders on the 15th instant. A dispatch at the office in this city reads—" \$50 with a surplus."

**GOULD & CURRY**—is little inquired for, realizing \$645 @ 620, then \$625 and \$650, buyer 5, and at the close \$615 is bid. The amount stated in the above table—\$1,605,228—represents the actual bullion receipts at the office in this city.

We refer our readers to the following interesting statement furnished us by the obliging Secretary of the company:

Ore and Bullion product of the Gould and Curry Mine from the date of its incorporation, (June 27, 1850) to November 30, 1866:

Dates.	Ore Worked etc.—Tons.	Bullion, Etc.	Av. Yld Per Ton.	Dividends Paid.
1850	.....	.....	.....	.....
July 1	Dec 13	140%	\$22,004 82	\$156 60
1850	Dec 13	.....	.....	.....

Total Product .....	234,795%	.....	.....	.....

**IMPERIAL**—rose from 130 to \$140, and closed yesterday at \$145. In the month of December, \$81,045.67 in bullion was received at the office in this city. On the 7th instant a dividend of \$8 per share will be paid to the stockholders of this company. On the 1st instant 3,712 tons of ore were on hand at the Rock Point mill—which is again working at full capacity—and at the dump of the mine 900 tons.

**EMPIRE**—has been inactive during the past week, selling at \$195, and closed yesterday at \$180. This company is in a very prosperous condition, and its mine is now perhaps in a more productive state than at any former period of its history. A dividend of \$10 per share is payable to-day.

**CHOLLAR-POROSS**—met with marked activity during the past week, some 700 shares changing hands, opening at \$217.50, improving to \$245, receding to \$228, and closing at \$242. The ore recently discovered in the first station main drift north, is now said to be three feet wide, and may be considered worth from \$35 to \$40 per ton. This deposit is 70 feet above the point where the Hale & Norcross company drifted over on the Chollar ground.

**OPHIR**—was quiet, selling at \$155, then at \$160 @ 157.50, and closed yesterday at \$154. Nothing of special interest from this mine. Work on the south drift from main shaft, on the 10th level, advances about two feet per day.

**CONFIDENCE**—improved from \$65 to \$75, then receded to \$50, and closed at \$60. During the month of December the bullion returns amounted to \$25,978.12. **BELOHER** improved from \$142.50 to \$180, closing at \$158. An assessment of \$15 per share was levied on the 1st instant.

**BULLION**—opened at \$36, advanced to \$44, receded to \$28, and closed yesterday at \$33.

**OVERMAN** fluctuated between \$16 and \$17.75—assessment of \$10 delinquent to-day.

**SIERRA NEVADA** sold from \$3.25 to \$5, then at \$2.50—assessment of \$4 delinquent.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$762,116.75.

## A Word to Readers in the Atlantic States.

Much complaint has reached us, through various sources, at the general lack of knowledge at the East, with regard to mining and other operations on this coast, and the frequent impositions practiced upon the public there, in consequence, by irresponsible persons passing off upon unsuspecting victims worthless mining stock, or persuading them, by false representations, to organize companies and advance moneys upon worthless ground, or ground which oftentimes has neither value or locality. If our friends at the East, who are still anxious to engage in the laudable venture of mining enterprise, would do so intelligently, let them subscribe for and carefully consult the only journal on the Pacific coast where every mining enterprise that is worth naming is, from time to time, noticed, as its merits may warrant. A mining enterprise on the Pacific coast, which is not referred to in this journal, in some way or other, as often as once in three or four months, is certainly one which people in the Atlantic States should beware of. Our advice to people at the East is never to venture small amounts in mining. If you must start small, let a number of such club together, so as to make the aggregate amount to be invested, such as may be worth your while to inquire into. Jan. 1, 1867.

It is a singular fact that the man who has been the most liberal to the poor of London is not an Englishman, but an American; and the man who proposes to spend \$5,000,000 for the poor of New York is not an American, but a Scotchman. They obtained their riches, however, in the cities they would benefit.

**PETROLEUM IN CALIFORNIA.**—The fact that the Petroleum oil belt in California extends from Humboldt county on the north, to Los Angeles on the south—a distance of seven hundred miles—is mentioned in the late report of the Register of the Land Office, together with other facts in proof of our great resources in this respect.

**DURING the Madoc (Canada) gold excitement,** one man offered, it is said, \$2,000 for the privilege of working the hole with a hoe for twenty-four hours.

**General Butler, Ben. Holladay, and others,** are interested in the company which is to colonize a portion of Lower California.

**PACIFIC HYGIENIC HOME WATER CURE,** at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACINTYRE, M. D., Attending Physician; W. G. W. HARFORD, Manager; J. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-tr

**OLNEY & Co.,** Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. 16v13

**NATURAL CURIOSITIES FOR CHRISTMAS.**—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shields, Sea-weeds, etc. 24v13-qr

**Air Pump for Sale.**—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN KOENIG, mathematical instrument maker, 522 Montgomery street. 24v13-qr

## To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 24v13-qr

## Consumption Cured.

**FULTON, Hamilton Co., Ohio, May 19, 1863—Gents:** This is to certify that my daughter was taken with a severe cold, which settled upon her lungs, attended with violent coughing. The cough became incessant and distressing, with pain and great difficulty of breathing. It went on until she was almost dead, when she was taken to the hospital, where she was examined by a physician, who said that she could not be cured, as she had the last stages of consumption. At this time she was induced to try ALLEN'S LUNG BALM, having heard of its many remarkable cures. On using the Balm, it seemed to go to the very seat of the disease at once, as it caused her to expectorate large quantities of phlegm. The cough began to mend; the soreness of the lungs was relieved; the strength and appetite returned. By the use of only three bottles, she, to all appearances, had recovered her health, and now feels as well as ever. Respectfully, yours, LUCIUS PECK.

Sold by all Medicine dealers every where. 14v14-lu

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## Calaveras County.

The San Andreas Register thus writes of Copperopolis: Though business is dull there at present, as it is everywhere, yet the people are buoyant with the hope of a brisk revival as soon as the spring is fairly opened, and travel is resumed as usual. A large number of the suspended mines will be re-opened and worked vigorously, and, we trust, with entire success. All that is necessary to make that one of the most flourishing mining towns in the State, is capital sufficient, and a wise and judicious use of it in developing the hundreds of lodes already known in that immediate vicinity.

## El Dorado County.

From the Courier of Jan. 5th: The Placerville Gold Mining Company was organized in this city on the 4th inst., with a capital stock of \$500,000, divided into 25,000 shares of \$20 each. . . . Chub Napier found near his cabin at Poverty Point, a few days since, a pocket, from which he took four ounces of gold.

A Brownsville correspondent of the Democrat says: The Independence claim, 1,200 feet in extent, was opened some three months ago, from which three runs have been made. The first run of 100 tons paid \$3,500. The next run of the same amount of rock came within ten dollars of paying as much as the first, and the third run of eighty-eight tons was cleaned up to-day, from which they obtained 600 ounces of amalgam, which, after retorting, will leave, perhaps, about 400 ounces of gold. . . . Mr. Norton and others are erecting a 5-stamp mill on the Still-wagon ledge. . . . The Confidence Company have rich rock on top, and are running a tunnel to strike the ledge at the depth of 200 feet. . . . The Vulture is a small but rich vein. Tunnel fifty feet. . . . The Georgia has a shaft twelve feet, with a small ledge prospecting \$100 per ton, and widening as it goes down.

## Kern County.

From the Havilah Courier of Dec. 29th: In Washington district, the Belmont lode is now being vigorously worked, and is producing very rich quartz. The ledge is about two feet in thickness, and the ore is easily extracted.

The William L. Yancey, owned by Henderson, Reynolds & Calhoun, is producing rock of the richest character. The lode is about eight inches in thickness, and from all appearances will pay over \$100 per ton.

H. T. Miller, who is working on an extension of the Yancey, has a shaft down over forty feet, and the ledge is over one foot in width, and the quartz taken from it is rich in gold.

Among other ledges now being worked, are the Cumberland, the Mountain Queen, the Greenbush, etc., etc. The late heavy rains will no doubt lead to the discovery of many blind lodes in this district. We understand that the late rise in Kern river has damaged the arastras considerably, and retarded the working of rock for a short time.

In Dahlona district, the Rupert lode, owned by Williams, Rogers & Martin, is, we learn, turning out finely. This is a large, well-defined ledge. . . . Donnell, Erskine & Davis have opened a very rich quartz lode in this district. . . . A new discovery has been made lately about four miles below this district, by Tinnan & Martin, of a large quartz lode, which prospects very finely on the top.

In Clear Creek district the Kellum & Wright mill has changed hands, and is now owned by men with the energy and capital to go ahead. The same parties have also purchased several lodes in this district, and we may expect soon to see the mill in active operation.

The Union mill (Piepers) and the Jenny Lind mine have been sold to Gidden & Williams and Oakes Ames, of Boston, Mass. . . . Wm. Marsh & Co. have lately been taking out very rich rock from the Venus lode.

The "New El Dorado District," east of Mount Swain, was organized in April. Four companies have located some thirty or forty lodes. Two of these only have accomplished anything. Of these two, the Clear Creek company have sunk two shafts of thirty feet each, and built a 22-foot overshot wheel, from lumber whip-sawed with their own hands. This wheel is intended to drive two 6-foot arastras and two stamps.

The other company, named the St. John, have sunk a shaft 115 feet, finding a vein from ten to twenty inches wide. They have been erasing rock from this vein for some time, by horse-power with arastra, and on the 17th instant, cleaned up from two arastras, after a five weeks' run, \$890. They purpose sinking their main shaft deeper.

## Mono County.

The Sacramento Union of Dec. 24th, says: Messrs. Whitney & Co., received yesterday from Shingle Springs, 3,000 pounds of silver bullion, from the Chrysopolis mine, in the Blind Spring district, Mono county, fifty-two miles south of Aurora. A furnace has been erected at this place for smelting the ore, and this is the product of the second smelting. The first smelting of fifty hours' continuance yielded three-quarters of a ton, which was shipped recently through Stockton. The present shipment was the product of six days' smelting. The 3,000 pounds, if pure silver, would be worth nearly \$50,000. The Camanche mine, in the same district, owned in part by the same stockholders, produces ore which yields about \$1,000 per ton, several shipments of which have passed through the city for transmission to Swansea.

## Nevada County.

From the Gazette of Jan. 5th: We learn from a gentleman down yesterday from You Bet, that Brown & Co., on Brown's Hill, cleaned up, on Sunday last, \$1,185 from five days' run of their mill. From the same we learn that Mallory & Company are doing first rate in their claims, adjoining Brown's.

A correspondent of the Grass Valley National, writing from You Bet, Dec. 27th, says: None of the cement mills are paying very largely at the present time. There are but few of them but what are paying more than expenses, and some of them have flattering prospects for good dividends soon. Messrs. Cozzins & Garber, who have been so unfortunate of late, have suspended working their cement mine at present. While drifting under the bed of Missouri Cañon, they had a cave, which extended to the surface and let in so much water that with their present machinery they are unable to pump it out.

The Chalk Mountain Blue Gravel Co., claiming several miles on what is supposed to be an ancient blue gravel channel, started an incline which they expected to have to run from 600 to 700 feet to strike the river bed, but through some miscalculation they struck it some 600 feet nearer the surface than was expected. They talk of moving farther up their claims to a more favorable location for opening up their mines.

The mills at Hunt's Hill are running, are crushing excellent cement, and are making good profits.

The Green Mountain Company, situated between Hunt's Hill and Quaker Hill, have had a very tedious time getting their mine open, and have been at a great expense. They have struck very rich gravel, and the mill is now paying well.

From the Transcript of Jan. 5th: The year 1867 opens auspiciously for Nevada county. The heavy storms of December, though they did much damage, brought their good. The tailings have been swept out of the ravines and gulches, and the hydraulic miner has a chance to lay his sluices with sufficient fall to wash the gold. The reservoirs are full, and in many localities there is an abundant supply of free water for the miners. Quartz mines are paying well. The cement mines of Little York township still continue to yield handsomely, and there is no longer a scarcity of water to keep the mills going. Hydraulic claims are being opened in every part of the county, and an immense amount of this kind of mining will be done during the year.

We learn that John Baldwin picked up a quartz specimen in a ravine on Gold Flat, on Monday last, worth between fifteen and twenty dollars.

EXCELSIOR.—From the Nevada Gazette of Jan. 7th: The U. S. Grant Company have been the most successful of the mining companies carrying on operations in Meadow Lake district during the past season. The claim is on the Ohio ledge. The ledge is five and a half feet in width. The mill has five stamps of 500 pounds each, and the capacity of the mill is seven tons a day. The number of tons reduced up to the present time is 271, and the gross yield \$13,398.57—being within a fraction of \$50 a ton. The cost of mining and hauling the rock is \$5.50 a ton, and the expense of crushing \$3.50, leaving a profit of \$40 a ton. Twenty men, on an average, are employed in the mill and mine. A 15-stamp mill will be erected in the Spring.

The Transcript of Jan. 6th says a bar of gold valued at between \$1,200 and \$1,900, the result of one week's run of the U. S. Grant mill, was brought down on Friday.

From the Meadow Lake Sun of Dec. 29th: The report of the Superintendent of the Mobawk and Montreal Company shows that 163 tons of ore had been crushed at the Winton mill, with an average yield of \$29.35 per ton.

Judge Tilford, who has retired from the editorial chair of the Meadow Lake Sun,

has just returned, says the Gold Hill News, of Jan. 3d, to Virginia. He reports the snow eight feet deep on the level at Meadow Lake, and the people housed up for the winter. Many of the mines, however, are being vigorously worked. The Golden Eagle Company will have their mill running within ten days. The company have out a large amount of splendid ore, free gold being visible to the naked eye in all of it. The U. S. Grant Co. keep their mill running all the time. The ore yields from \$50 to \$80 per ton on the average. The California Co. have succeeded in getting all their matters straightened up, and work is being pushed forward; the stock, which two months since was not worth more than \$2 per share, is now worth \$15. The Mohawk Co. except to have their mill in running order within a few weeks. The Enterprise mill, erected on the Enterprise mine, by Goss & Lambard, has been crushed in by the snow, and the whole concern has gone to wreck.

## Placer County.

From the Stars and Stripes of January 2d: Captain Mallett has purchased a half interest in the Badger company's claims and ground, located at the head of Badger ravine, near Gold Hill, for the sum of \$3,000 cash, and is to erect and have a mill running on the same by the first of February. All the ravines heading in the ridge west of Auburn, which ridge extends a distance of about eleven miles to the plains below, have furnished rich surface diggings in the past, and the cement formation, which is very extensive, has invariably paid well for the time and capital employed in working it.

From the Dutch Flat Enquirer of January 2d: The mines in the vicinity of Gold Run, we learn, are yielding larger returns this season than at any former time.

From the Placer Herald of January 5th: Captain Mallett has already purchased his mill, and will have it running in thirty or forty days.

Some of the mine owners about Forest Hill and Yankee Jim are proposing to hire Chinese to work their claims. We learn that an indignation meeting was held at the "Hill" on Saturday evening last.

## Sierra County.

From the Messenger of January 5th: The Good Hope are still working their ledge with a view of securing a heavier back. There is a rumor that they will put up a mill in the spring. . . . The Montpelier company are, pending the completion of their tunnel, at work clearing out the old working of the Wheeler ledge—part of their purchase—with a view of sinking down, if practicable. . . . Anderson & Co., who have been working Sing Canon, near Cowdery's quartz mill, took out, a few days since, a slug that weighed seventy-five dollars. . . . Cunningham & Co. are preparing to flume Slug Canon, near the old saw mill, and are busily at work constructing a dam and putting in boxes. . . . We hear that at Eureka, Morristown and other hydraulic diggings throughout the county, water is plentiful, and miners are jubilant with pipe and pick. A few weeks of water now, insures success in the spring. . . . A new quartz ledge has been discovered near Indian Hill, which abounds well in free gold.

The Sling Canon mill has been entirely remodeled. It was started on New Year's day to test its working, and everything went to a charm. It has five stamps, and will crush from six to eight tons of quartz per day. Eight men are employed in the mine and mill.

Letter to same paper from Howland Flat says: A fair amount of gold is being produced—more than usual for the time of year. The different mining companies are doing very well. The Union, Down East, and Mountaineer companies are reputed to be in a thriving condition, while other companies are paying fairly. The Hawkeye company are nearly opened again, as before, while their new tunnel is going on rapidly from the Howland Flat side. This new tunnel is named the El Dorado. The tunnel of the Monumental company is still being driven along. The rock, which has been hard for a very long time, shows signs of changing. The Pittsburg company are employing the same number of hands as usual—about forty-five. The suspension was only for two days.

Letter from Indian Hill: Jones & Co. have fitted up in good style the old Gregg claims that have lain idle for the last seven years. . . . Charlton & Co. have added six hundred feet of pipe and a second distributor. Their claims have already yielded about ninety thousand dollars. During the late storm a land slide did them some \$300 damage. . . . Andrews & Co. have run a tunnel about three hundred feet. . . . Bliss & Co. have got some good prospects at the east end of the town. . . . The ditch agent, while out during the late storm, discovered some very rich quartz. A few ounces pounded in a hand-

mortar and panned out in a sancer, gave product good for \$200 per ton. The discovery was made on the north fork of Indian Creek.

Letter from Pine Grove, December 25th: Snow four feet deep, and still coming down with that wild fury peculiar only to a Sierra snow storm. All outside business suspended. Tunnel mining being pushed ahead with vigor, yielding the usual good results.

## Siskiyou County.

A dispatch, dated Yreka, Jan. 3d, says: The weather for the past three weeks has been very stormy, especially in the mountains, where snow has fallen to a great depth. Scott and Klamath rivers have been so high, as to stop stages. Mining on the bars has been suspended for the present. Accounts from all the mining districts show that the miners have plenty of water, with a fair prospect of a good clean up in the spring. The snow on Scott Mountain is from twelve to fifteen feet deep.

## Yuba County.

From the Marysville Appeal of Jan. 3d: On New Year's day, at one o'clock in the afternoon, the 100-horse engine was started and all the machinery—16-stamp battery, 10 inch pump, carriages for lifting ore, two Chile mills, etc., etc.—moved off to the entire satisfaction of all. The company have about 150 tons of rock on the surface. The mill will crush about thirty-five tons per day, which yields \$16 to \$45 per ton.

The Bateman Company, of Indiana Ranel district, has struck a very rich rock. This company has been taking out good pay rock for some time, and hauling it to the mill or Templar No. 2 to be crushed. The last strike appears to be better than ever.

From the North Californian of Jan. 7th: The works of the Unconditional Union Company are twelve miles from Oroville, and two and one-half miles south of the La Porte road. The claims embrace 4,000 feet on two ledges. Shaft have been sunk for prospecting 2,000 feet, and a tunnel is now within a few weeks of completion, which will tap both ledges at a depth of 300 feet below the surface. Through this tunnel the quartz can be delivered at the mill for sixty cents per ton.

## NEVADA.

## Esmeralda—

A letter to the Territorial Enterprise from Wilson district, dated Pine Grove, Jan. 1st, has the following items: Work on the mill is now going ahead with all reasonable dispatch. I am informed by one of the proprietors that in five weeks from the day the last load of machinery arrives, (which will probably be this week), the steam whistle will startle the Piutes of Wilson district. Part of an arastra mill has been brought in and the rest will soon be here. This mill, it is said, will be in operation within twenty days. A number of arastras will also be in operation in a short time.

On several of the mines operations have commenced in good earnest. The Wilson and Midas Companies, on the Himalaya and other parallel ledges, have started a joint tunnel to prospect their claims. This tunnel will be run with all possible dispatch. The Wheeler Company, on the Mastodon ledge, are now at work in the old shaft, and are down fifteen or eighteen feet. To-day, I visited the Wheeler mine, and saw the richest rock yet found in this district. Out of each tubful raised while we were there, it was almost impossible to find a piece of rock which did not show free gold. As the shaft goes down the rock improves and the ledge is better defined. On the Hamilton ledge a contract has been let by the Hamilton and Forrest Companies, to sink a shaft twenty-five feet, and the contractor is now busy at work. Other companies will soon begin operations.

## Reese River—

From the Revelle of Dec. 27th: A. T. Gould has received one-half of the southern location on the Keystone ledge. He has two shifts engaged in taking out ore, and expects to keep the mill of the Consolidated Company in full work.

Prof. Everett has sunk to the depth of fifteen feet on the Hunter mine, and exposed a fine body of ore fully fifteen feet wide.

The New York and Social Company, in Egan Canon, have had their mill running for a week. The principally developed ledge of the company, the Gilligan, is being worked again, and is yielding as fine ore as of old.

From same of 29th: The Morgan and Muncey is being put in fine condition. At the greatest depth of the incline the vein displays handsome mineral of a remarkably compact body, and blushes all over with tints of ruby. Preparations are being made to stoop from the lower level. . . . We learn that a complete 5-stamp mill will be taken to the Revelle district immediately, where it will be erected and put to crushing ore. . . . The Keystone mill will close this evening for necessary repairs. After being thor-

oroughly overhauled, it will resume operations about the 15th of January.

In Mammoth district, the Mount Vernon Company are continuing their work both upon shaft and tunnel with very satisfactory results, having struck a ledge of rich ore in the shaft of about twenty-five feet in thickness. The owners of the Uncle Sam group have made arrangements with the superintendent of the Knickerbocker mill at Lone to work about one hundred and fifty tons of their rock, which they have commenced getting out. Ferguson & Co. are still at work on the American Flag, the ledge increasing in width and the quartz in richness as they descend. They are down with the shaft about one hundred and fifteen feet, showing a ledge about six feet wide. They intend soon to start a drift, and also to continue the shaft for thirty or forty feet yet. The Superintendent of the Ural Silver Mining Company, C. E. Gillet, has been having rock worked from several of the ledges in this district—the Ural, Gould & Curry, Albany, Kearsarge and Robinson, among the number—all of which "work" at figures that will pay even from the surface with a good mill near by; the figures being from \$60 to \$100 per ton in silver.

From same of January 2d: The new mill of the Combination Company, just completed in the Hot Creek district, commenced crushing ore on the morning of the 27th ult.

Some 650 pounds of bullion were brought into town yesterday from the mill of the Twin River Company.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Jan. 1st: Thomas Farrell has brought an action to recover mining ground and \$500,000 damages from the Savage Company. The ground claimed is a portion of the front ledge, just east of the Comstock, known as the Mitchell lode, and includes six hundred feet, extending north from the Hale & Norcross north line.

From same of 5th: The damages caused by the flood in Carson river, to the dams, etc., a couple of weeks ago, are now repaired, and all the mills in the vicinity of Dayton are in full operation crushing ore from the old Comstock.

Same of 6th: The new shaft of the Imperial and Empiro companies has now attained a depth of 750 feet, and the work of sinking deeper is being actively prosecuted.

At Edwards & Wiegand's assay office, Gold Hill, yesterday, was a pile of twenty-seven silver bars, worth about \$40,000; all from the Crown Point mine. The crude bullion used in the manufacture of these bricks, when brought to the office, weighed three-quarters of a ton.

We present the following report of bullion shipped from the office of Wells, Fargo & Co., in this city, during the past year of 1866, just merely to give some idea of the vast amount of wealth produced from the great Comstock lode. This is independent of what is shipped from their office at Gold Hill or anywhere else:

January.....	\$520,177 20
February.....	402,322 91
March.....	705,210 33
April.....	616,387 50
May.....	618,776 71
June.....	561,938 70
July.....	595,503 77
August.....	779,276 59
September.....	643,063 97
October.....	686,517 23
November.....	739,512 30
December.....	786,436 96
Total.....	\$7,807,616 18

From the Gold Hill *News* of Dec. 24th: The Petaluma mill is almost ready to commence running. The batteries, four in number, with four 700-pound stamps, are built in the most improved style, and in the most substantial manner. The pans are of the Wheeler pattern, but much larger than ordinary. There are eight, and it is calculated they will work thirty tons every twenty-four hours.

From same of Jan. 4th: Yesterday we were down to see the Savage works, at what is known as the Curtis shaft. The new 250-horse power engine pump is in full operation, and a more complete engine and machinery we have never seen any place than this. The machinery works perfectly noiseless, while in the gearing a wooden wheel works against an iron one, making the thing perfectly quiet.

For over two weeks the roads have been so miry that it has been impossible to deliver the ore at the mills. Many of the teams have hauled off, while those that are at work cannot deliver more than half the amount they could if the roads were in good condition. Many of the mills are lying idle for want of ore, while many of the mines have been compelled to suspend

operations for want of dumping room for the ore that is being taken out. This is the cause of the deficiency in our shipments. The mines of the Comstock ledge never looked more promising than they do at the present time, nor have they ever yielded more paying ore than now. At the Savage there is in the new dumps at the present time 2,000 tons of first-class ore, which will give a yield of not less than \$80,000 to say the least of it. In fact all the mines where pay ore is being taken out is in the same condition.

From the *Virginia Union* of Jan. 2d: At this time there is fifty tons of first-class ore at the Yellow Jacket new works awaiting shipment. It assays from \$400 to \$500 per ton. The Petaluma mill started up yesterday on the Savage ore.

From same of 4th: We learn that there have recently been a number of rich ledges located beyond and to the east of Death Valley and in the Black Mountains. We were shown some of the ore. Horn silver is plentiful in it, and the entire quartz abounds in sulphurets. The ledges are from eight to thirty feet in width, and crop out prominently, being traceable for a long distance on the mountain side. The region is excellently watered and wooded.

A telegram from Gold Hill, Jan. 8th, says: The Yellow Jacket north mine opened into a new body of ore to-day, 140 feet east of that on the level above. It looks fine.

#### ARIZONA.

From the *Miner* of Dec. 15th: The ore from the Ticonderoga mine in Goodwin district, near Big Bug, is being worked at Woolsey's mill, yielding from \$50 to \$100 per ton. The lead is about seven feet wide.

Our favored mine the Sterling, now promises wealth and happiness to its lucky owners. No mine in Nevada nor California has ever surpassed it in product or prospects. Since the last clean-up a most thorough and careful examination of the mine has been made by competent and experienced men, with the most satisfactory results. If Uncle Samuel or some other human power will exterminate our infernal redskins, so that men can come here safely, we may look for times well remembered in Nevada in '61-2 and 3. No such prospects were then known in that State, nor do we believe there is a place on the Pacific coast that promises so well for mining as this section of Arizona at this moment.

In the neighborhood of the Sterling are several other mines, known and proved to be very rich and reliable. The Muehella and Umpqua are both being worked, and have exceeded the expectations of their owners.

The *La Paz Gazette* of Dec. 13th, says that Noyes' 10-stamp mill had arrived from Fort Yuma a few days previous.

#### BRITISH COLUMBIA.

Victoria dates to Jan. 5th: Mr. Jerrold, with a party of eight, arrived last week from Big Bend. There are between fifty and sixty persons wintering on French Creek. The weather was not severe when Mr. Jerrold left, and snow lay to the depth of two feet. Gold Hill claim, on this creek, excites considerable interest, and more confidence is felt in its richness. A mining company has been organized to prospect ground in the rear of this claim. Five men were at work on Discovery claim, making two or three ounces per day rocking their dirt. Three other companies in the creek are at work with satisfactory results. In McCulloch's Creek three companies are at work.

Parties from Cariboo report most companies doing well on William's Creek. The Taylor claim has prospects of ten dollars to the pan. The Grouse Creek claims are doing well. Low Creek is also improving. Canon and Cedar Creeks are being thoroughly prospected; much enthusiasm is felt in the result. About 1,000 persons are wintering in and about Cariboo.

A valuable coal seam has been discovered within twenty miles from Victoria.

The prospects for working the Bellingham Bay coal mines are improving. A new pump has been erected.

#### COLORADO.

From the *Journal* of Dec. 18th: G. H. Sabin is starting up on the Union Company's claim, on the Bates. G. R. Mitchell is fitting up the mill erected by Mr. Tobin, for crushing ore from the Alps. Yesterday hands were put on the Consolidated Gregory's claim. The company will soon be in full blast. Truman Whitcomb, of Nevada, is running his 12-stamp mill on ore from the California lode. The ore appears to be rich. Lyon's Furnace Company have a nice lot of tailings matted. They are running but one furnace, and one desulphurizer at present. J. D. Peregrine's new 24-stamp mill is being pushed rapidly towards completion, and is situated

immediately below Lyon's furnace. The Ophir Company are fixing up their railway and putting on new cars. They are also erecting a new building to cover the lode. They are also about putting in a new engine for hoisting, together with a pump. The Briggs Company commenced this morning on the Gregory. The mill will not be set going at present. Mr. Vissing is operating the Monnier process, in the mill erected by Mr. Fink. He has commenced desulphurizing. The Smith & Parmelee Company have struck very rich pay on the west end of their mine. They are running the 25-stamp mill; the Empire mill, eighteen stamps, and the Fitzpatrick mill of eight stamps. We were handed a fine specimen taken from the Waterloo lode, Idaho district. At a depth of thirty-three feet the crevice is said to be four feet between walls.

The Sonora company have drifted into a crevice in the Agnes lode 100 feet, and have a vein of \$70 ore. They are well supplied with means for a winter's campaign. In Georgetown, Smith & Herriek have nearly completed their furnace. The Washington Company have commenced to erect large smelting works.

From the *Denver News* of Dec. 19th: A specimen from the Summit lode, Georgetown, gave by assay \$2,000 per ton.

Hoyt, Widener & Co. have just struck a solid mass or concentration of quartz veins, some 300 feet in width, on James' Creek. The rock is rich in gold, silver and lead, and is one of the finest smelting ores in Colorado. This lead is to be worked by the Etina Tunnel Company.

The Sterling mill is crushing Bobtail ore worth from \$150 to \$200 per cord. Hale & Co. are opening the Etina lead just below. They have run in some 150 feet. The 60-stamp Black Hawk mill is running on Gregory ore. Twenty stamps will soon be added. The Briggs Company are hoisting water, preparatory to resuming operations. The Consolidated Gregory will resume full work as soon as the lower level is drained.

Five mills are now running at Empire, and turning out from two to five thousand dollars per week. Mr. Leeper's mill, with the Keith process, has not yet got down to steady work, but soon will. His works are very complete.

In the neighborhood of Georgetown, some very rich silver discoveries have recently been made, and there is a good deal of excitement about them.

A good deal of gold washing is being done all along Clear Creek, and with satisfactory results. The water has got down low, so that miners can get down into the bars, from which they were barred out all summer.

#### IDAHO.

From the *Avalanche* of Dec. 22d: In the Woodstock, the prospects are gratifying. Two lots of ore crushed in the Webfoot mill, paid something over expenses. The ledge has been so far opened that a ton of ore is extracted daily. We were shown several pounds of it on Wednesday, and it all shows rich in sulphurets of silver and much free gold. The lowest depth is twenty-seven feet. A tunnel has been started and ore will be taken out all winter. The vein has every appearance of being a true one, and is now two and one-half feet thick.

The Shoenbar mill is to start this morning. All things were in readiness yesterday and the whistle that has been silent for just a year will be heard again. Lots of ore from the Silver Cord, Dashaway, Whisky Gulch, and probably from the Vulcan, will be crushed.

The Reuter & Johnson ledge is paying wages right along. The ore is worked in an arastra. As stated months ago, these men patiently prospected many months for this ledge and paid their way by working float quartz in a hand mortar.

The Reynolds Creek Coal Company is sanguine of finding coal in paying quantities. The tunnel now reaches into the hill over two hundred feet, and is being pushed forward. Timbers are provided for a full winter's work, and the company is determined to find coal in a large body or spend much money and labor trying.

From the *Times* of Dec. 11th: "The mining in the creek has not altogether been suspended as yet, notwithstanding the cold weather. Several companies are yet at work, and innumerable rockers are telling every day upon the resources of this country. We have heard very little of late from the company formed for the purpose of putting a bedrock flume in More's Creek. A large number of miners in the immediate vicinity of Idaho City and Buena Vista Bar are engaged in drifting out pay dirt, and the winter and early spring promise to be unusually lively in the way of mining."

#### MONTANA.

From the *Post* of Dec. 15th: Ten pounds of ore from the Copperopolis lead in Vi-

vian county, assayed 33 per cent. of pure copper, and yielded gold at the rate of \$40 per ton, and silver at the rate of \$600 per ton.

The Midas Company, which is largely engaged in mining operations in Nevada, and owns one mill containing eighty stamps, is permanently located in the Hot Spring district. Professor Ward is superintendent, and has erected several buildings, including a fine one for an engine and machinery. A large number of workmen are employed by this company in extracting quartz, which will be crushed during the winter.

There has been considerable excitement created over the discovery of the dry gulches around Indian Creek, and from what we can learn from parties who have visited the section, the mines bid fair. A ditch some five miles in length is being brought in by Messrs. Coover & Thompson.

Helena items: Trinity Gulch was discovered on Dec. 1st, near "Lost Horse." It prospects from fifteen to sixty-five cents to the pan. Postlethwaite & Co. have erected a 24-stamp mill, at a cost of \$40,000. Heald & Front have an exceedingly rich lead about half a mile above the intersection of the Rattlesnake and New York gulches. Two tons of ore yielded \$311. The shaft is thirty-five feet deep. The ore is worked in an arastra. Judge L. G. Turnley's mill cleaned up from a four day's run of fifty-five tons of Whitelake Union ore, \$3,708, with two stamps hanging up. Unfortunately the breaking of several stamps compelled the machinery to stop.

Letter to same paper from Red Mountain, Highland Gulch, says: We have here two very rich leads lately discovered, the Ballarat and the Evans. There are but two claims being worked at present in the gulch, and they belong to Mansfield and Heifner. The first takes out about \$2,000 per week, the latter about \$1,400. When the work stopped in the gulch, the miners were averaging from \$20 to \$100 per day.

George Aitkin, engineer of the Montana Mining and Prospecting Company, reports most favorably of the veins recently examined by him. We quote from the *Brooklyn Union*: "The Toledo, Alameda, Mother Heudricks and Uncle Tom are equal, by common mill process, in free gold, to \$100 per ton. These lodes will now command \$5,000 per claim. On the Alameda, at the Seneca Falls mill, I worked seven thousand pounds, by weight, took up clean gold \$360, and could not save half of it by the old way of running it on copper plates. It is now \$20,000 per claim of 200 feet."

Mr. Cope's mill in Hot Spring district, has been running for two months. Some 200 tons from various lodes during that time have yielded about \$10,500.

#### OREGON.

Jacksonville news of January 4th, is to the effect that gold has been again struck in the celebrated Ish or Gold Hill lead, and the prospects are very flattering.

IMPROVEMENT IN THE REFINING OF GOLD AND SILVER.—Andrew Mason, melter and refiner in the New York assay office, has made an improvement in the mode of parting gold and silver, which is to be introduced into all the branch mints. It consists in so adjusting the metals for granulation that the pure gold, instead of gold bullion, shall constitute one-third of the mixed metal; and secondly, in boiling the gold in sulphuric acid, after one treatment in nitric acid. The one charge of nitric acid is to be made larger than the first in the old process, but 20 per cent. less than the amount in both, while the consumption of fuel is greatly reduced, and much disagreeable labor removed. It is estimated that the saving in one year's business would amount to \$70,000, rating the cost of mining in California at 50 per cent. greater than in New York. The economy in the above mode of parting, consists in the employment of a less quantity of nitric acid than has heretofore been used, which is replaced by sulphuric acid—the latter costing only about one-third as much as the former.

IRON IN SANTA CRUZ COUNTY.—The Santa Cruz *Sentinel* of the 22d of December says an extensive bed of iron ore has been discovered a few miles north of that place, near the beach. Wood and water are plenty, and it is spoken of as a good chance to invest.

TWO HUNDRED and twenty millions pounds of paper is used every year in England. The United States consumes four hundred and forty millions of pounds.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## Calaveras County.

The San Andreas Register thus writes of Copperopolis: Though business is dull there at present, as it is everywhere, yet the people are buoyant with the hope of a brisk revival as soon as the spring is fairly opened, and travel is resumed as usual. A large number of the suspended mines will be re-opened and worked vigorously, and, we trust, with entire success. All that is necessary to make that one of the most flourishing mining towns in the State, is capital sufficient, and a wise and judicious use of it in developing the hundreds of lodes already known in that immediate vicinity.

## El Dorado County.

From the Courier of Jan. 5th: The Placerville Gold Mining Company was organized in this city on the 4th inst., with a capital stock of \$500,000, divided into 25,000 shares of \$20 each. . . . Chub Napier found near his cabin at Poverty Point, a few days since, a pocket, from which he took four ounces of gold.

A Brownsville correspondent of the Democrat says: The Independence claim, 1,200 feet in extent, was opened some three months ago, from which three runs have been made. The first run of 100 tons paid \$3,500. The next run of the same amount of rock came within ten dollars of paying as much as the first, and the third run of eighty-eight tons was cleaned, up to-day, from which they obtained 600 ounces of amalgam, which, after retorting, will leave, perhaps, about 400 ounces of gold. . . . Mr. Norton and others are erecting a 5-stamp mill on the Stillwagon ledge. . . . The Confidence Company have rich rock on top, and are running a tunnel to strike the ledge at the depth of 200 feet. . . . The Vulture is a small but rich vein. Tunnel fifty feet. . . . The Georgia has a shaft twelve feet, with a small ledge prospecting \$100 per ton, and widening as it goes down.

## Kern County.

From the Havilah Courier of Dec. 29th: In Washington district, the Belmont lode is now being vigorously worked, and is producing very rich quartz. The ledge is about two feet in thickness, and the ore is easily extracted.

The William L. Yancey, owned by Henderson, Reynolds & Calhoun, is producing rock of the richest character. The lode is about eight inches in thickness, and from all appearances will pay over \$100 per ton.

H. T. Miller, who is working on an extension of the Yancey, has a shaft down over forty feet, and the ledge is over one foot in width, and the quartz taken from it is rich in gold.

Among other ledges now being worked, are the Cumberland, the Mountain Queen, the Greenbush, etc., etc. The late heavy rains will no doubt lead to the discovery of many blind lodes in this district. We understand that the late rise in Kern river has damaged the arastras considerably, and retarded the working of rock for a short time.

In Dahlonega district, the Rupert lode, owned by Williams, Rogers & Martin, is, we learn, turning out finely. This is a large, well-defined ledge. . . . Donnell, Erskine & Davis have opened a very rich quartz lode in this district. . . . A new discovery has been made lately about four miles below this district, by Tinnan & Martin, of a large quartz lode, which prospects very finely on the top.

In Clear Creek district the Kellum & Wright mill has changed hands, and is now owned by men with the energy and capital to go ahead. The same parties have also purchased several lodes in this district, and we may expect soon to see the mill in active operation.

The Union mill (Piepers) and the Jenny Lind mine have been sold to Glidden & Williams and Oakes Ames, of Boston, Mass. . . . Wm. Marsh & Co. have lately been taking out very rich rock from the Venus lode.

The "New El Dorado District," east of Mount Swain, was organized in April. Four companies have located some thirty or forty lodes. Two of these only have accomplished anything. Of these two, the Clear Creek company have sunk two shafts of thirty feet each, and built a 22-foot overshot wheel, from lumber whip-sawed with their own hands. This wheel is intended to drive two 6-foot arastras and two stamps.

The other company, named the St. John, have sunk a shaft 115 feet, finding a vein from ten to twenty inches wide. They have been crushing rock from this vein for some time, by horse-power with arastras, and on the 17th instant, cleaned up from two arastras, after a five weeks' run, \$890. They purpose sinking their main shaft deeper.

## Mono County.

The Sacramento Union of Dec. 24th, says: Messrs. Whitney & Co., received yesterday from Shingle Springs, 3,000 pounds of silver bullion, from the Chrysopolis mine, in the Blind Spring district, Mono county, fifty-two miles south of Aurora. A furnace has been erected at this place for smelting the ore, and this is the product of the second smelting. The first smelting of fifty hours' continuance yielded three-quarters of a ton, which was shipped recently through Stockton. The present shipment was the product of six days' smelting. The 3,000 pounds, if pure silver, would be worth nearly \$50,000. The Camanche mine, in the same district, owned in part by the same stockholders, produces ore which yields about \$1,000 per ton, several shipments of which have passed through the city for transmission to Swansea.

## Nevada County.

From the Gazette of Jan. 5th: We learn from a gentleman down yesterday from You Bet, that Brown & Co., on Brown's Hill, cleaned up, on Sunday last, \$1,185 from five days' run of their mill. From the same we learn that Mallory & Company are doing first rate in their claims, adjoining Brown's.

A correspondent of the Grass Valley National, writing from You Bet, Dec. 27th, says: None of the cement mills are paying very largely at the present time. There are but few of them but what are paying more than expenses, and some of them have flattering prospects for good dividends soon. Messrs. Cozzins & Garber, who have been so unfortunate of late, have suspended working their cement mine at present. While drifting under the bed of Missouri Cañon, they had a cave, which extended to the surface and let in so much water that with their present machinery they are unable to pump it out.

The Chalk Mountain Blue Gravel Co., claiming several miles on what is supposed to be an ancient blue gravel channel, started an incline which they expected to have to run from 600 to 700 feet to strike the river bed, but through some miscalculation they struck it some 600 feet nearer the surface than was expected. They talk of moving farther up their claims to a more favorable location for opening up their mines.

The mills at Hunt's Hill are running, are crushing excellent cement, and are making good profits.

The Green Mountain Company, situated between Hunt's Hill and Quaker Hill, have had a very tedious time getting their mine open, and have been at a great expense. They have struck very rich gravel, and the mill is now paying well.

From the Transcript of Jan. 5th: The year 1867 opens auspiciously for Nevada county. The heavy storms of December, though they did much damage, brought their good. The tailings have been swept out of the ravines and gulches, and the hydraulic miner has a chance to lay his sluices with sufficient fall to wash the gold. The reservoirs are full, and in many localities there is an abundant supply of free water for the miners. Quartz mines are paying well. The cement mines of Little York township still continue to yield handsomely, and there is no longer a scarcity of water to keep the mills going. Hydraulic claims are being opened in every part of the county, and an immense amount of this kind of mining will be done during the year.

We learn that John Baldwin picked up a quartz specimen in a ravine on Gold Flat, on Monday last, worth between fifteen and twenty dollars.

EXCELSIOR.—From the Nevada Gazette of Jan 7th: The U. S. Grant Company have been the most successful of the mining companies carrying on operations in Meadow Lake district during the past season. The claim is on the Ohio ledge. The ledge is five and a half feet in width. The mill has five stamps of 500 pounds each, and the capacity of the mill is seven tons a day. The number of tons reduced up to the present time is 271, and the gross yield \$13,398.57—being within a fraction of \$50 a ton. The cost of mining and hauling the rock is \$5.50 a ton, and the expense of crushing \$3.50, leaving a profit of \$40 a ton. Twenty men, on an average, are employed in the mill and mine. A 15-stamp mill will be erected in the Spring.

The Transcript of Jan. 6th says a bar of gold valued at between \$1,200 and \$1,300, the result of one week's run of the U. S. Grant mill, was brought down on Friday.

From the Meadow Lake Sun of Dec. 20th: The report of the Superintendent of the Mohawk and Montreal Company shows that 163 tons of ore had been crushed at the Winton mill, with an average yield of \$29.35 per ton.

Judge Tilford, who has retired from the editorial chair of the Meadow Lake Sun,

has just returned, says the Gold Hill News, of Jan. 3d, to Virginia. He reports the snow eight feet deep on the level at Meadow Lake, and the people housed up for the winter. Many of the mines, however, are being vigorously worked. The Golden Eagle Company will have their mill running within ten days. The company have out a large amount of splendid ore, free gold being visible to the naked eye in all of it. The U. S. Grant Co. keep their mill running all the time. The ore yields from \$50 to \$80 per ton on the average. The California Co. have succeeded in getting all their matters straightened out, and work is being pushed forward; the stock, which two months since was not worth more than \$2 per share, is now worth \$15. The Mohawk Co. except to have their mill in running order within a few weeks. The Enterprise mill, erected on the Enterprise mine, by Goss & Lambard, has been crushed in by the snow, and the whole concern has gone to wreck.

## Placer County.

From the Stars and Stripes of January 2d: Captain Mallett has purchased a half interest in the Badger company's claims and ground, located at the head of Badger ravine, near Gold Hill, for the sum of \$3,000 cash, and is to erect and have a mill running on the same by the first of February. All the ravines heading in the ridge west of Auburn, which ridge extends a distance of about eleven miles to the plains below, have furnished rich surface diggings in the past, and the cement formation, which is very extensive, has invariably paid well for the time and capital employed in working it.

From the Dutch Flat Enquirer of January 2d: The mines in the vicinity of Gold Run, we learn, are yielding larger returns this season than at any former time.

From the Placer Herald of January 5th: Captain Mallett has already purchased his mill, and will have it running in thirty or forty days.

Some of the mine owners about Forest Hill and Yankee Jim are proposing to hire Chinese to work their claims. We learn that an indignation meeting was held at the "Hill" on Saturday evening last.

## Sierra County.

From the Messenger of January 5th: The Good Hope are still working their ledge with a view of securing a heavier back. There is a rumor that they will put up a mill in the spring. . . . The Montpelier company are, pending the completion of their tunnel, at work clearing out the old working of the Wheeler ledge—part of their purchase—with a view of sinking down, if practicable. . . . Anderson & Co., who have been working Slug Canon, near Cowdery's quartz mill, took out, a few days since, a slug that weighed seventy-five dollars. . . . Cunningham & Co. are preparing to flume Slug Canon, near the old saw mill, and are busily at work constructing a dam and putting in boxes. . . . We hear that at Eureka, Morris-town and other hydraulic diggings throughout the county, water is plentiful, and miners are jubilant with pipe and pick. A few weeks of water now, insures success in the spring. . . . A new quartz ledge has been discovered near Indian Hill, which abounds well in free gold.

The Slug Canon mill has been entirely remodeled. It was started on New Year's day to test its working, and everything went to a charm. It has five stamps, and will crush from six to eight tons of quartz per day. Eight men are employed in the mine and mill.

Letter to same paper from Howland Flat says: A fair amount of gold is being produced—more than usual for the time of year. The different mining companies are doing very well. The Union, Down East, and Mountaineer companies are reputed to be in a thriving condition, while other companies are paying fairly. The Hawkeye company are nearly opened again, as before, while their new tunnel is going on rapidly from the Howland Flat side. This new tunnel is named the El Dorado. The tunnel of the Monumental company is still being driven along. The rock, which has been hard for a very long time, shows signs of changing. The Pittsburg company are employing the same number of hands as usual—about forty-five. The suspension was only for two days.

Letter from Indian Hill: Jones & Co. have fitted up in good style the old Gregg claims that have lain idle for the last seven years. . . . Charlton & Co. have added six hundred feet of pipe and a second distributor. Their claims have already yielded about ninety thousand dollars. During the late storm a land slide did them some \$300 damage. . . . Andrews & Co. have run a tunnel about three hundred feet. . . . Bliss & Co. have got some good prospects at the east end of the town. . . . The ditch agent, while out during the late storm, discovered some very rich quartz. A few ounces pounded in a hand-

mortar and panned out in a saucer, gave a product good for \$200 per ton. The discovery was made on the north fork of Indian Creek.

Letter from Pine Grove, December 25th: Snow four feet deep, and still coming down with that wild fury peculiar only to a Sierra snow storm. All outside business suspended. Tunnel mining being pushed ahead with vigor, yielding the usual good results.

## Siskiyou County.

A dispatch, dated Yreka, Jan. 3d, says: The weather for the past three weeks has been very stormy, especially in the mountains, where snow has fallen to a great depth. Scott and Klamath rivers have been so high as to stop stages. Mining on the bars has been suspended for the present. Accounts from all the mining districts show that the miners have plenty of water, with a fair prospect of a good clean up in the spring. The snow on Scott Mountain is from twelve to fifteen feet deep.

## Yuba County.

From the Marysville Appeal of Jan. 3d: On New Year's day, at one o'clock in the afternoon, the 100-horse engine was started and all the machinery—16-stamp battery, 10-inch pump, carriages for lifting ore, two Chile mills, etc., etc.—moved off to the entire satisfaction of all. The company have about 150 tons of rock on the surface. The mill will crush about thirty-five tons per day, which yields \$16 to \$45 per ton.

The Bateman Company, of Indiana Ranch district, has struck a very rich rock. This company has been taking out good pay rock for some time, and hauling it to the mill of Templar No. 2 to be crushed. The last strike appears to be better than ever.

From the North Californian of Jan. 7th: The works of the Unconditional Union Company are twelve miles from Oroville, and two and one-half miles south of the La Porte road. The claims embrace 4,000 feet on two ledges. Shafts have been sunk for prospecting 2,000 feet, and a tunnel is now within a few weeks of completion, which will tap both ledges at a depth of 300 feet below the surface. Through this tunnel the quartz can be delivered at the mill for sixty cents per ton.

## NEVADA.

## Esmeralda—

A letter to the Territorial Enterprise from Wilson district, dated Pine Grove, Jan. 1st, has the following items: Work on the mill is now going ahead with all reasonable dispatch. I am informed by one of the proprietors that in five weeks from the day the last load of machinery arrives, (which will probably be this week), the steam whistle will startle the Piutes of Wilson district. Part of an arastra mill has been brought in and the rest will soon be here. This mill, it is said, will be in operation within twenty days. A number of arastras will also be in operation in a short time.

On several of the mines operations have commenced in good earnest. The Wilson and Midas Companies, on the Hinalaya and other parallel ledges, have started a joint tunnel to prospect their claims. This tunnel will be run with all possible dispatch. The Wheeler Company, on the Mastodon ledge, are now at work in the old shaft, and are down fifteen or eighteen feet. To-day, I visited the Wheeler mine, and saw the richest rock yet found in this district. Out of each tubful raised while we were there, it was almost impossible to find a piece of rock which did not show free gold. As the shaft goes down the rock improves and the ledge is better defined. On the Hamilton ledge a contract has been let by the Hamilton and Forrest Companies, to sink a shaft twenty-five feet, and the contractor is now busy at work. Other companies will soon begin operations.

## Reese River—

From the Reville of Dec. 27th: A. T. Gould has received one-half of the southern location on the Keystone ledge. He has two shifts engaged in taking out ore, and expects to keep the mill of the Consolidated Company in full work.

Prof. Everett has sunk to the depth of fifteen feet on the Hunter mine, and exposed a fine body of ore fully fifteen feet wide.

The New York and Social Company, in Egan Canon, have had their mill running for a week. The principally developed ledge of the company, the Gilligan, is being worked again, and is yielding as fine ore as of old.

From same of 29th: The Morgan and Muncey is being put in fine condition. At the greatest depth of the incline the vein displays handsome mineral of a remarkably compact body, and blushes all over with tints of ruby. Preparations are being made to stoop from the lower level. . . . We learn that a complete 5-stamp mill will be taken to the Reville district immediately, where it will be erected and put to crushing ore. . . . The Keystone mill will close this evening for necessary repairs. After being thor-

oughly overhauled, it will resume operations about the 15th of January.

In Mammoth district, the Mount Vernon Company are continuing their work both upon shaft and tunnel with very satisfactory results, having struck a ledge of rich ore in the shaft of about twenty-five feet in thickness. The owners of the Uncle Sam group have made arrangements with the superintendent of the Knickerbocker mill at Lone to work about one hundred and fifty tons of their rock, which they have commenced getting out. Ferguson & Co. are still at work on the American Flag, the ledge increasing in width and the quartz in richness as they descend. They are down with the shaft about one hundred and fifteen feet, showing a ledge about six feet wide. They intend soon to start a drift, and also to continue the shaft for thirty or forty feet yet. The Superintendent of the Ural Silver Mining Company, C. E. Gillet, has been having rock worked from several of the ledges in this district—the Ural, Gould & Curry, Albany, Kearsarge and Robinson, among the number—all of which "work" at figures that will pay even from the surface with a good mill near by; the figures being from \$60 to \$100 per ton in silver.

From same of January 2d: The new mill of the Combination Company, just completed in the Hot Creek district, commenced crushing ore on the morning of the 27th ult.

Some 650 pounds of bullion were brought into town yesterday from the mill of the Twin River Company.

#### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Jan. 1st: Thomas Farrell has brought an action to recover mining ground and \$500,000 damages from the Savage Company. The ground claimed is a portion of the front ledge, just east of the Comstock, known as the Mitchell lode, and includes six hundred feet, extending north from the Hale & Norcross north line.

From same of 5th: The damages caused by the flood in Carson river, to the dams, etc., a couple of weeks ago, are now repaired, and all the mills in the vicinity of Dayton are in full operation crushing ore from the old Comstock.

Same of 6th: The new shaft of the Imperial and Empire companies has now attained a depth of 750 feet, and the work of sinking deeper is being actively prosecuted.

At Edwards & Wiegand's assay office, Gold Hill, yesterday, was a pile of twenty-seven silver bars, worth about \$40,000; all from the Crown Point mine. The crude bullion used in the manufacture of these bricks, when brought to the office, weighed three-quarters of a ton.

We present the following report of bullion shipped from the office of Wells, Fargo & Co., in this city, during the past year of 1866, just merely to give some idea of the vast amount of wealth produced from the great Comstock lode. This is independent of what is shipped from their office at Gold Hill or anywhere else:

January.....	\$520,177 20
February.....	492,322 91
March.....	705,210 33
April.....	646,387 90
May.....	618,776 71
June.....	562,938 70
July.....	595,503 77
August.....	779,276 50
September.....	643,963 97
October.....	586,517 25
November.....	730,512 30
December.....	786,438 98

Total.....\$7,807,616 18

From the *Gold Hill News* of Dec. 24th: The Petaluma mill is almost ready to commence running. The batteries, four in number, with four 700-pound stamps, are built in the most improved style, and in the most substantial manner. The pans are of the Wheeler pattern, but much larger than ordinary. There are eight, and it is calculated they will work thirty tons every twenty-four hours.

From same of Jan. 4th: Yesterday we were down to see the Savage works, at what is known as the Curtis shaft. The new 250-horse power engine pump is in full operation, and a more complete engine and machinery we have never seen any place than this. The machinery works perfectly noiseless, while in the gearing a wooden wheel works against an iron one, making the thing perfectly quiet.

For over two weeks the roads have been so miry that it has been impossible to deliver the ore at the mills. Many of the teams have hauled off, while those that are at work cannot deliver more than half the amount they could if the roads were in good condition. Many of the mills are lying idle for want of ore, while many of the mines have been compelled to suspend

operations for want of dumping room for the ore that is being taken out. This is the cause of the deficiency in our shipments. The mines of the Comstock ledge never looked more promising than they do at the present time, nor have they ever yielded more paying ore than now. At the Savage there is in the new dumps at the present time 2,000 tons of first-class ore, which will give a yield of not less than \$80,000 to say the least of it. In fact all the mines where pay ore is being taken out is in the same condition.

From the *Virginia Union* of Jan. 2d: At this time there is fifty tons of first-class ore at the Yellow Jacket new works awaiting shipment. It assays from \$400 to \$500 per ton....The Petaluma mill started up yesterday on the Savage ore.

From same of 4th: We learn that there have recently been a number of rich ledges located beyond and to the east of Death Valley and in the Black Mountains. We were shown some of the ore. Horn silver is plentiful in it, and the entire quartz abounds in sulphurets. The ledges are from eight to thirty feet in width, and crop out prominently, being traceable for a long distance on the mountain side. The region is excellently watered and wooded.

A telegram from Gold Hill, Jan. 8th, says: The Yellow Jacket north mine opened into a new body of ore to-day, 140 feet east of that on the level above. It looks fine.

#### ARIZONA.

From the *Miner* of Dec. 15th: The ore from the Ticonderoga mine in Goodwin district, near Big Bug, is being worked at Woolsey's mill, yielding from \$50 to \$100 per ton. The lead is about seven feet wide.

Our favored mine the Sterling, now promises wealth and happiness to its lucky owners. No mine in Nevada nor California has ever surpassed it in product or prospects. Since the last clean-up a most thorough and careful examination of the mine has been made by competent and experienced men, with the most satisfactory results. If Uncle Samuel or some other human power will exterminate our infernal redskins, so that men can come here safely, we may look for times well remembered in Nevada in '61-2 and 3. No such prospects were then known in that State, nor do we believe there is a place on the Pacific coast that promises so well for mining as this section of Arizona at this moment.

In the neighborhood of the Sterling are several other mines, known and proved to be very rich and reliable. The Mucella and Umpqua are both being worked, and have exceeded the expectations of their owners.

The *La Paz Gazette* of Dec. 13th, says that Noyes' 10-stamp mill had arrived from Fort Yuma a few days previous.

#### BRITISH COLUMBIA,

Victoria dates to Jan. 5th: Mr. Jerrold, with a party of eight, arrived last week from Big Bend. There are between fifty and sixty persons wintering on French Creek. The weather was not severe when Mr. Jerrold left, and snow lay to the depth of two feet. Gold Hill claim, on this creek, excites considerable interest, and more confidence is felt in its richness. A mining company has been organized to prospect ground in the rear of this claim. Five men were at work on Discovery claim, making two or three ounces per day rocking their dirt. Three other companies in the creek are at work with satisfactory results. In McCulloch's Creek three companies are at work.

Parties from Cariboo report most companies doing well on William's Creek. The Taylor claim has prospects of ten dollars to the pan. The Grouse Creek claims are doing well. Low Creek is also improving. Canon and Cedar Creeks are being thoroughly prospected; much enthusiasm is felt in the result. About 1,000 persons are wintering in and about Cariboo.

A valuable coal seam has been discovered within twenty miles from Victoria.

The prospects for working the Bellingham Bay coal mines are improving. A new pump has been erected.

#### COLORADO.

From the *Journal* of Dec. 18th: G. H. Sabin is starting up on the Union Company's claim, on the Bates....G. R. Mitchell is fitting up the mill erected by Mr. Tobin, for crushing ore from the Alps....Yesterday hands were put on the Consolidated Gregory's claim. The company will soon be in full blast....Truman Whitcomb, of Nevada, is running his 12-stamp mill on ore from the California lode. The ore appears to be rich....Lyon's Furnace Company have a nice lot of tailings matted. They are running but one furnace, and one desulphurizer at present....J. D. Pergrine's new 24-stamp mill is being pushed rapidly towards completion, and is situated

immediately below Lyon's furnace....The Ophir Company are fixing up their railway and putting on new cars. They are also erecting a new building to cover the lode. They are also about putting in a new engine for hoisting, together with a pump....The Briggs Company commenced this morning on the Gregory. The mill will not be set going at present....Mr. Vissing is operating the Monnier process, in the mill erected by Mr. Fink. He has commenced desulphurizing....The Smith & Parmelee Company have struck very rich pay on the west end of their mine. They are running the 25-stamp mill; the Empire mill, eighteen stamps, and the Fitzpatrick mill of eight stamps....We were handed a fine specimen taken from the Waterloo lode, Idaho district. At a depth of thirty-three feet the crevice is said to be four feet between walls.

The Sonora company have drifted into a crevice in the Agnes lode 100 feet, and have a vein of \$70 ore. They are well supplied with means for a winter's campaign. In Georgetown, Smith & Herriek have nearly completed their furnace. The Washington Company have commenced to erect large smelting works.

From the *Denver News* of Dec. 19th: A specimen from the Summit lode, Georgetown, gave by assay \$2,000 per ton.

Hoyt, Wideuer & Co. have just struck a solid mass or concentration of quartz veins, some 300 feet in width, on James' Creek. The rock is rich in gold, silver and lead, and is one of the finest smelting ores in Colorado. This lead is to be worked by the Aetna Tunnel Company.

The Sterling mill is crushing Bobtail ore worth from \$150 to \$200 per cord....Hale & Co. are opening the Aetna lead just below. They have run in some 150 feet....The 60-stamp Black Hawk mill is running on Gregory ore. Twenty stamps will soon be added....The Briggs Company are hoisting water, preparatory to resuming operations....The Consolidated Gregory will resume full work as soon as the lower level is drained.

Five mills are now running at Empire, and turning out from two to five thousand dollars per week. Mr. Leeper's mill, with the Keith process, has not yet got down to steady work, but soon will. His works are very complete.

In the neighborhood of Georgetown, some very rich silver discoveries have recently been made, and there is a good deal of excitement about them.

A good deal of gold washing is being done all along Clear Creek, and with satisfactory results. The water has got down low, so that miners can get down into the bars, from which they were barred out all summer.

#### IDAHO.

From the *Avalanche* of Dec. 22d: In the Woodstock, the prospects are gratifying. Two lots of ore crushed in the Wehfoot mill, paid something over expenses. The ledge has been so far opened that a ton of ore is extracted daily. We were shown several pounds of it on Wednesday, and it all shows rich in sulphurets of silver and much free gold. The lowest depth is twenty-seven feet. A tunnel has been started and ore will be taken out all winter. The vein has every appearance of being a true one, and is now two and one-half feet thick.

The Shoebar mill is to start this morning. All things were in readiness yesterday and the whistle that has been silent for just a year will be heard again. Lots of ore from the Silver Cord, Dashaway, Whisky Gulch, and probably from the Vulcan, will be crushed.

The Reuter & Johnson ledge is paying wages right along. The ore is worked in an arastra. As stated months ago, these men patiently prospected many months for this ledge and paid their way by working float quartz in a hand mortar.

The Reynolds Creek Coal Company is sanguine of finding coal in paying quantities. The tunnel now reaches into the hill over two hundred feet, and is being pushed forward. Timbers are provided for a full winter's work, and the company is determined to find coal in a large body or spend much money and labor trying.

From the *Times* of Dec. 11th: "The mining in the creek has not altogether been suspended as yet, notwithstanding the cold weather. Several companies are yet at work, and innumerable rockers are telling every day upon the resources of this country. We have heard very little of late from the company formed for the purpose of putting a bedrock flume in More's Creek. A large number of miners in the immediate vicinity of Idaho City and Buena Vista Bar are engaged in drifting out pay dirt, and the winter and early spring promise to be unusually lively in the way of mining."

#### MONTANA.

From the *Post* of Dec. 15th: Ten pounds of ore from the Copperopolis lead in Vi-

vian county, assayed 33 per cent. of pure copper, and yielded gold at the rate of \$40 per ton, and silver at the rate of \$600 per ton.

The Midas Company, which is largely engaged in mining operations in Nevada, and owns one mill containing eighty stamps, is permanently located in the Hot Spring district. Professor Ward is superintendent, and has erected several buildings, including a fine one for an engine and machinery. A large number of workmen are employed by this company in extracting quartz, which will be crushed during the winter.

There has been considerable excitement created over the discovery of the dry gulches around Indian Creek, and from what we can learn from parties who have visited the section, the mines bid fair. A ditch some five miles in length is being brought in by Messrs. Coover & Thompson.

Helena items: Trinity Gulch was discovered on Dec. 1st, near "Lost Horse." It prospects from fifteen to sixty-five cents to the pan....Postlethwaite & Co. have erected a 24-stamp mill, at a cost of \$40,000....Heald & Front have an exceedingly rich lead about half a mile above the intersection of the Rattlesnake and New York gulches. Two tons of ore yielded \$311. The shaft is thirty-five feet deep. The ore is worked in an arastra....Judge L. G. Turnley's mill cleaned up from a four day's run of fifty-five tons of Whitelatch Union ore, \$3,708, with two stamps hanging up. Unfortunately the breaking of several stamps compelled the machinery to stop.

Letter to same paper from Red Mountain, Highland Gulch, says: We have here two very rich leads lately discovered, the Ballarat and the Evans. There are but two claims being worked at present in the gulch, and they belong to Mansfield and Heifner. The first takes out about \$2,000 per week, the latter about \$1,400. When the work stopped in the gulch, the miners were averaging from \$20 to \$100 per day.

George Aitkin, engineer of the Montana Mining and Prospecting Company, reports most favorably of the veins recently examined by him. We quote from the *Brooklyn Union*: "The Toledo, Alameda, Mother Hendricks and Uncle Tom are equal, by common mill process, in free gold, to \$100 per ton. These lodes will now command \$5,000 per claim. On the Alameda, at the Seneca Falls mill, I worked seven thousand pounds, by weight, took up clean gold \$360, and could not save half of it by the old way of running it on copper plates. It is now \$20,000 per claim of 200 feet."

Mr. Cope's mill in Hot Spring district, has been running for two months. Some 200 tons from various lodes during that time have yielded about \$10,500.

#### OREGON.

Jacksonville news of January 4th, is to the effect that gold has been again struck in the celebrated Ish or Gold Hill lead, and the prospects are very flattering.

IMPROVEMENT IN THE REFINING OF GOLD AND SILVER.—Andrew Mason, melter and refiner in the New York assay office, has made an improvement in the mode of parting gold and silver, which is to be introduced into all the branch mints. It consists in so adjusting the metals for granulation that the pure gold, instead of gold bullion, shall constitute one-third of the mixed metal; and secondly, in boiling the gold in sulphuric acid, after one treatment in nitric acid. The one charge of nitric acid is to be made larger than the first in the old process, but 20 per cent. less than the amount in both, while the consumption of fuel is greatly reduced, and much disagreeable labor removed. It is estimated that the saving in one year's business would amount to \$70,000, rating the cost of mining in California at 50 per cent. greater than in New York. The economy in the above mode of parting, consists in the employment of a less quantity of nitric acid than has heretofore been used, which is replaced by sulphuric acid—the latter costing only about one-third as much as the former.

IRON IN SANTA CRUZ COUNTY.—The Santa Cruz *Sentinel* of the 22d of December says an extensive bed of iron ore has been discovered a few miles north of that place, near the beach. Wood and water are plenty, and it is spoken of as a good chance to invest.

TWO HUNDRED and twenty millions pounds of paper is used every year in England. The United States consumes four hundred and forty millions of pounds.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

**Mr. Thomas Starr** is Agent for the MINING and SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

**Mr. A. C. Knox**, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 11th, 1867.

**Mr. L. W. Felton**, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

**Mr. S. D. Whitaker**, is our authorized Traveling Agent and Solicitor from this date. Jan. 1, 1867.

## San Francisco:

Saturday Morning, Jan. 12, 1867.

## NOTICES TO CORRESPONDENTS.

"PATRIOT"—OUR ORNAMENTAL AND ORDINARY BUILDING MATERIALS.—Your suggestion is an excellent one. A complete series of these objects ought to be obtained and forwarded to the Paris Exposition, in order to exhibit our resources in this respect. To the intending, prudent emigrant, scarcely any subject will be more eagerly sought after. Specimens of our useful and ornamental woods ought to form one department. Another and highly interesting one, should consist of assorted specimens of our different rocks, suitable for the purposes alluded to—cubic specimens of about three inches cube—one or more sides being polished would suffice for purposes of illustration. For the better carrying out this idea, we submit the following brief notices of some of the principal articles which might be furnished:

**Granite**—The Folsom quarries afford granite susceptible of the highest polish. Other varieties could be furnished from various quarters.

**Porphyry**—Nevada State and the southeastern parts of California, can furnish excellent specimens of porphyry.

**Marble—Ordinary and Hydraulic Limestones**.—Tuolumne, Santa Cruz, and other counties, can furnish abundance of these calcareous materials.

**Verde Antique—Serpentine**.—San Francisco, Calaveras, Mariposa, and many other counties, can supply admirable specimens of these varieties of ornamental building stones.

**Jasper**.—Judging from what is seen on the coast hills forming the southwestern border of San Francisco county, it is highly probable that this durable and beautiful substance, hitherto obtainable only in limited quantities, chiefly from Siberia and Russia, is now procured to almost any required extent at St. Gervais, in Savoy, where the quarry has a surface of at least 24,000 square yards, and a depth of about twenty-two yards. It is a variety of quartz, which is characterized by being opaque, however thin the plates into which it may be cut, and is of various colors—red, brown, green, etc.; that at present used for jewelry being green, with red spots, commonly known by the name of blood-stone. It resists for indefinite periods the action of the weather, and is an excellent material for ornamentation, whether as stands for small objects, etc., or as panels, columns, etc., to be used by the architect. Some of what is found at St. Gervais bears close resemblance to the beautiful species termed *rouge antique*; it is of a fine red, and without veins. There are many reasons for anticipating that California will be found equally, if not more abundantly furnished with this substance, than either the Urals, Siberia or Savoy. Prof. Rowlandson, in his articles which have appeared in this paper on the "Age of Gold-Bearing Rocks," has made pointed allusion to the similarly jaspitious character of the auriferous district of the Urals, with many parts of California, and the marked similarity of geological appearances between this State and that portion of northern Italy comprising Savoy.

**Steatite**.—Is another substance of which California can furnish an abundance of splendid specimens.

Almost the whole of the above articles would make a beautiful appearance, if converted into small polished vases, tazzas, or other elegant forms.

**Clays**.—Suitable for making ordinary and fire-bricks, ought not to be omitted—the former comes home to almost every man, and the latter is a great commercial and manufacturing need.

"S. T."—ATMOSPHERIC PERCUSSION ENGINES have long been known. The first published account of an air-gun is to be found in the *Elemens d' Artillerie*, of David Rivaud, who was preceptor to Louis XIII. He ascribes the invention to Marin, of Lisieux, who presented one to Henry IV. of France.

## MINING PROSPECTS FOR 1867.

The new year opens auspiciously for the mining interests of the Pacific coast. The abundance of snow which has fallen in the higher Sierras must insure a full supply of water for the ditches throughout another year, to which source, almost exclusively, the placer miners now look for the means of carrying on their operations during the long, dry months of summer. The idea that our placer mines are soon to become exhausted, has now been pretty well exploded. The developments of the past three or four years have pretty fully established the fact, that what is known as "ancient river beds," constitutes by far the largest portion of the riches of our placers. This ancient drift is far more extensive than was originally supposed, and is now found to cover a large portion of the area of all the central counties of the State. Instead of being confined to mere ancient *river beds*, it is more than probable that it once covered almost the entire of what is now the western flank of the Sierras, and that the chief portion of the gold in our present rivers and gulches must have been derived from that ancient drift, to the origin and source of which no clue has yet been discovered. So vast and extensive is this deposit, that it must furnish employment for generations to come.

The placer developments about Folsom, the past season, appear to indicate that even another drift, more ancient, perhaps, than that already alluded to, and presenting quite different characteristics, has been discovered. At that place, we are told that the miners have worked down to what they supposed to be the true bedrock—a rock presenting the same characteristics, for a radius of about ten miles around. During the past summer, some ambitious miner has penetrated this rock, and found beneath it a very valuable deposit of gold-bearing drift, made up entirely of quartz gravel and rock. The gold taken out appears to be but little water-worn, quite different from that found in the old river beds, higher up in the mountains. The deposit is considerably lower than the bed of the American river. Quite a number of companies are now working on this new deposit, with very good success. The belief prevails among the miners about Folsom that this unexpected discovery will lead to most important results, greatly enlarging the field of mining operations in the foot-hills. The deposit covering this gold is of marine origin, containing numerous shells, and showing that since the gold found its way there, the country has been depressed beneath the flow of the ocean, from which it has again arisen to its present elevation.

The experience of the past few years has pretty fully shown that all the more valuable portions of our ancient gravel deposits will pay for crushing—a more tedious and expensive manner of extracting their auriferous contents than that of obtaining the gold by sluicing; but yet one which gives such increased results as to more than pay the extra expense attending it. The machine requirements for this process, also, furnishes a large amount of work for mechanics and foundrymen.

Our quartz interests were never more prosperous than at the present time. Speculative mining is fast giving place to legitimate operations. The general success attending it is fast implanting a degree of confidence in the minds of capitalists which is most hopeful for the future. One of the most interesting and significant features with regard to quartz mining operations, especially in this State, is the almost or quite universal success which has attended deep sinking. Not a single instance of failure has come within our notice, when a depth of four or five hundred feet has been attained; on the contrary, we have heard of several cases where mines which were abandoned, in years past, because they would not pay at a depth of two hundred or two

hundred and fifty feet, have recently been re-entered and sunk to twice that depth, with most encouraging results.

Improved machinery; more skillful management, assisted by better skilled labor; increased facilities for travel and transportation, and a consequent decrease in the cost of living, are all contributing, by cheapening the cost of working, to bring into value mines which heretofore could not be worked on account of the lack of these facilities. On the whole, no year has opened with more flattering prospects for the miner than the present.

## THE NEW LETTERS PATENT.

The printing of the "Letters Patent" is now in full operation, and one of the earliest issues is before us. The reduced size of the sheet is a great improvement, as well as the method of folding and securing the several parts together. The typography and general style is excellent, with the exception of a lack of margin, which might be remedied by a slight increase in the size of the sheet. The design of the *vignette* is very beautiful. The prominent central figure represents the Goddess of Liberty, grasping the Stars and Stripes in her right hand, while in her left she holds a wreath. At her feet crouches the American Eagle, with an olive branch in its talons. Upon either side is seen the Roman *fascies*, emblematic of authority. Upon the left of the picture, and in the foreground, is seen a female figure with cards and spinning wheel, while just in the rear, a large carding machine stands prominently out, showing by the contrast the vast stride which has been effected by modern invention over the slow and tedious process with which, from the time that Abel tended his flocks, down to near the present century, the great labor of preparing "clothing for the million" has been attended. Still further to the left is seen a sheet of water, bearing upon its bosom a steamer approaching its dock; while in the distance is also seen a great city, with its warehouses, workshops, tall chimneys, spires, etc. Upon the right foreground is seen a field of grain, ripe for the harvest, while a laborer has stopped short in his work, resting his sickle upon his shoulder, and gazing in apparent astonishment at a modern mowing machine, which comes galloping towards him, cutting its broad, clean swath, and accomplishing more in an hour than he, with his sickle, could accomplish in days. Still further in the rear is seen a locomotive, with its train of cars just emerging from a tunnel through the mountains; while the telegraph, that miracle of modern invention, is seen stretching out its attenuated wires from pole to pole—the great highway of thought and annihilator of time and space. The background of the whole is neatly shaded with hill, dale and mountain, beyond and above which the fleeting clouds swim in their aerial ocean. Mr. Theaker has accomplished much in every way, in improving the business and general arrangement of the Patent Office since he has been at its head, not the least of which is the desirable change which has been effected in the issue and "make-up" of the "Letters Patent."

**ANGULAR PADDLE WHEEL**.—We understand that the patentees have disposed of the United States Patent to a company of Eastern capitalists for a large consideration, and that immediate steps will be taken to develop the maximum advantages of the new theory on the North River.

**PERSONAL**.—The numerous friends of Dr. J. Macgowan, may be interested to learn that he, with his family and fellow-passengers, arrived safely at Hongkong on the 4th of November, after a pleasant passage of forty-four days from this port.

**COMMUNICATIONS RECEIVED**.—From A. W. Arents, a description of a supposed new mineral; from J. Mosheimer, some further account of "Rittinger's Funnel or Pointed Boxes," together with a notice of the distinguished mining engineer, whose name they bear.

## ENSLEY'S NEW PATENT GAS.

We made a brief mention of this new illuminating gas in our issue of two weeks ago, since which time we have received a call from Mr. J. M. Whitesides, who has secured the patent right for its manufacture on the Pacific coast. The first introduction of this gas was made at Komoku, Canada West, where it has created quite a sensation among scientific men and others, to whom its character and mode of production has been made known. Numerous individuals, scientific and practical, have visited the works, to see for themselves that of which they had heard. The editors of several of the leading Canadian journals have also either visited the works in person, or sent thither special reporters; all of whom, so far as we have been able to learn, have expressed the most entire satisfaction at the success of the invention.

A more extensive trial of the gas has since been made in the city of Detroit, Michigan, where works on a large scale have been erected, and on the 27th of July last, the Hall of the Board of Trade of that city was beautifully illuminated, the light being declared by all present equal to that of the best coal gas. The latest exhibition of this gas has been made at the town of Coburg, Canada West, a city of 5,000 inhabitants, where it has been substituted for the ordinary coal gas, which has been made there for the past ten years. The papers in that city and vicinity have given very extended notices of it, pronouncing it a perfect success. The test of practical success thus seems to have established this as one of the most important inventions of this age of scientific discovery. We understand that an experimental trial of the same will soon be made in this city, and elsewhere on the Pacific coast.

The merits of the invention consists in the economy of the manufacture, the cheapness with which the works can be constructed, the facility with which existing works can be altered for the production of the new gas, and the quality of the light and the facility with which it may be introduced into small towns, manufactories, public buildings, etc. The material used in the manufacture is green pinewood and bones, and other animal refuse. The works at Komoku, which are merely intended to illuminate a single building, a seminary of learning, have cost only \$500, including a gasometer of a capacity of 600 cubic feet. It is claimed that the total cost of manufacture may be entirely defrayed by the residuum of the manufacture, which consists of charcoal, bone-black, tar, and oil of turpentine.

The gas requires no purification whatever, but passes directly from the retorts, through the condenser into the gasometer, for general distribution. At the point of its exit from the condenser, a trial light is kept constantly burning, by which the director of the works can always see, from hour to hour, just the character of gas he is producing, the properties of which, if at any moment it falls below the requisite standard, can be almost instantly regulated by an increased addition to the retorts, of wood or animal matter, as may be needed.

Common cylindrical retorts are used, which are fed by a simple and ingenious contrivance, which makes their action almost continuous. A common wheelbarrow full of wood, with about one-third the quantity of animal refuse, will produce an average of about 460 feet of gas. The matter is placed in separate retorts, and about one hour and a half is required to extract the gas from the charge. The process of the manufacture is the same as that employed in making ordinary gas, with the exception of the apparatus required for purification, which in this gas is entirely dispensed with.

**CONCENTRATORS**.—H. J. Booth & Co., of the Union Foundry, during the past week have forwarded two of Hendy's latest improved concentrators to the Gold Hill mill, and one to the Houston mill, in Grass Valley.

## THE MISSION OF STEAM.

It is difficult, at a glance, to form more than a mere approximate idea of what steam has done, or may yet accomplish, toward both the moral and physical elevation of the human race. Scarce two generations have passed away since a celebrated philosopher foretold that this agent, which was then quite limited in its application, would at an early day result in an important elevation of man in the scale of society, by being employed to do the chief part of his drudgery; leaving himself to perform skilled labor alone, and consequently to the more uninterrupted exercise of intellectual employment. The fulfillment of this prophesy has been brought about at a much earlier day than could have been anticipated, even by the far-reaching intellect which could at that time have conceived of such an idea. Had it not have been for steam, the whole civilized world might at this time have been but little in advance of China and Japan, in the arts and sciences, and in all those mechanical appliances which distinguish civilized from savage life. Even the harmonizing and elevating tendencies of the Christian religion would have been perverted and made of little effect, had it not been for the intellectual development which has been brought about, either directly or indirectly, by the introduction and varied application of steam. This wonder-working agent has created a demand for skilled labor, which could have been called into exercise in no other supposable manner. This labor has, in turn, induced an intellectual employment, profound, analytic and practical, which has so elevated and enlightened the masses as to place them beyond the reach of that priestcraft and kingcraft, which, during the middle ages, had so turned back the tide of human progress that it was fast verging upon original barbarism.

Skilled labor is in every way elevating in its tendencies. It is an active, thinking, progressive reality. Whether we contemplate it in an intellectual or a utilitarian point of view, it has a growing desire for improvement. It creates a thirst for general knowledge, on the one hand, while on the other it manifests a ceaseless activity in devising new ways and means for substituting mechanical appliances, wherever labor and force are still employed. Aided by mathematical science, it has of late years been surprised and stimulated by its own success, until it seems to think there is no conceivable problem beyond its power, except breathing into the creations of its own ingenuity the breath of life.

The skilled labor of the present day is a very different thing from that which flourished, to a limited extent, only, at the dawn of modern civilization—when the great aim of the student was the discovery of the philosopher's stone or the transmutation of metals. The mechanical ingenuity of that age was exhausted in building automaton figures, which should perform the functions of men and animals—like the writing boy of Droz, or the duck of Vaucanson, which, it was said, ate and digested food. The aim of the industrial inventor of that age sought only to devise contrivances which should fulfill the thousand services of *one man*; while the mechanical ingenuity of to-day is exerted in producing machines which shall perform a single service, but in doing so take the place of a *thousand men*. The artisans of the present day have a philosopher's stone, indeed; one whose magic touch not only brings gold to their coffers, but one which relieves them from the drudgery of life—an obedient servant, whose iron arms and never-tiring muscles are ready to do their bidding, wherever mere labor, without thought, is required; leaving to man an almost uninterrupted exercise and improvement of those intellectual faculties, the proper development of which are gradually elevating him toward that high and God-like position which the Creator designed he should occupy when, as His crowning work, He made him in His own image, and pronounced him good.

THE National Library at Washington has 136,000 volumes. It is the only thoroughly fire-proof library building in the world.

## CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet and recorded with the name of the donor, and the claim or location from whence it came.

H. W. O. MARGARY, of Boise City, sends us a box of specimens representing quite a number of mines in Alturas county, Idaho. We enumerate as follows:

120. From the Electoral Company, South Boise district, showing considerable free gold. This specimen presents the characteristics common to much of our California gold-bearing quartz, when taken from near the surface.

121. Old Ophir, South Boise district. This is quite an interesting specimen, containing a large amount of what appears to be an arsenical iron pyrites frequent in well-defined crystals, with strong indications of the presence of nickel.

122. Confederato Star, South Boise district; quartz containing a large percentage of sulphurets, finely diffused, so as to give it a bluish tint, with occasional aggregations of crystals, evidently auriferous.

123. Idaho, same district, and apparently from the same vein.

124. Webster; this specimen, which is also from South Boise district, was evidently taken from near the surface, as it contains a large percentage of sulphurets, in a state of partial decomposition from the action of the atmosphere.

125. Havermire, from Yuba district. This appears to be a surface specimen, tinted with yellow; the origin of this color we are unable to state, without further examination.

126. Silver Till, Yuba district, contains a large percentage of sulphurets, may be either argentiferous or auriferous, or both.

127. We suppose, from the label, the name of the mine from which this specimen is taken is the "New." The description already given of No. 121, answers equally well for this also. If it has not already been done, we should suppose the proprietors of both these mines would do well to have an analysis made of their ores—especially if the samples sent are anything like average samples of their ores. These mines are situated in different districts.

128. "76," Yuba district, is a specimen of decomposed sulphuret-bearing quartz, with evident indications of its being auriferous.

129. "Greenback," also from Yuba. Judging from the appearance of this specimen, rich in silver, carrying also copper and perhaps gold, we should judge that it took its name from its color, and we trust its value will not prove it to be a misnomer.

130. Pacific (near top), Yuba district, carries sulphurets and galena.

131. From the Morning Star, Owyhee, received with the above, will be described next week.

132. A "Hair Ball" from the stomach of an ox, from D. B. R., of Ione Valley, though not a specimen of the mineral kingdom, is nevertheless a valuable curiosity, and will receive a place in our cabinet. We shall give some account of those somewhat extraordinary animal aggregations next week.

## ARIZONA—PROTECTION AGAINST THE INDIANS.

Notwithstanding the Indian annoyances in Central Arizona, mining operations there are being pushed with vigor. In our next issue we propose to give a list of the quartz mills and some description of the mines. It is pleasing to know that Governor McCormick's application for more troops has met with a favorable response, and that four new companies have been assigned to the region around Prescott, two of which will go forward by the steamer of the 15th instant, while the other two will probably follow by the next subsequent steamer.

It is the opinion of those well informed that nothing but the hostility of the Indians, which delays and intercepts all business, prevents the speedy occupation of Central Arizona by a large population, and the successful development of mines of great value. We understand that Governor McCormick will remain in this city until the last quota of troops are ready to embark, when he will accompany them to Arizona. Those which leave on the 15th instant, will remain in Wilmington until the Governor's arrival, by which time all needed transportation, etc., will be in readiness for the entire division to take up its line of march at once.

It is much to be regretted that the War Department cannot be brought to realize more fully the actual condition and needs of such portions of our Pacific territories, and the great Overland route, as are seriously troubled by the presence of hostile Indians. If the entire business of protecting our territories against the Indians could be placed in the hands of men who are intimately acquainted with Indian habits and warfare, the security would be vastly increased, while the cost would at the same time be immeasurably lessened. We have no doubt but that the military authorities on this coast, who have been brought face to face with these difficulties, fully understand and admit this fact; but we suppose the Washington authorities are so imbued with the necessity and importance of the old red tape system of military operations, that any effort to change the same would be of little avail.

DR. McDONALD's new castor oil press, in Marysville, is thus described by the *North Californian*: "It is an upright press, with a screw  $4\frac{1}{2}$  inches in diameter, with a 'follower,' which fits in a cylinder eighteen inches long and twelve inches in diameter, and so arranged that the 'cake' or pressed beans can be taken out at the bottom at the will of the operator."

## City Amusements.

METROPOLITAN.—"Mazulu; or, The Night Owl," has retained its place here during the week, and is so attractive that it will probably not be withdrawn for some nights yet. The new ballet of "The Prima Donna" was performed the first time on Thursday evening.

OPERA HOUSE.—Lady Don's farewell benefit took place at this Theater on Wednesday night, on which occasion the house was crowded. Thursday night, "Never too Late to Mend" was given.

ACADEMY OF MUSIC.—Haley's Japanese have proved even a greater success than the first troupe. Their performances are varied and finished, and by no means the least attractive is that they are able to perform to American music.

THE New York *Tribune* says that in 1870 there will be twenty daily coaches running each way over the short gap which will at that time remain open in the trans-continental railway.

## Attention! Attention! Attention!

Look to Your Health in Time!

HEALY'S RHEUMATIC LINIMENT, FOR THE SORE and speedy extermination of Pain, having no equal in the world, is now being universally sought after by all classes throughout the Pacific Coast. The Miner, the Merchant, the Laborer, the Farmer, the Soldier, the Sailor, the Invalid, pronounce it the Greatest Remedy of the age. Are you afflicted with Rheumatism?

Have you the Headache? Use Healy's Rheumatic Liniment!

Have you a Sore Throat? Use Healy's Rheumatic Liniment!

Have you the Toothache? Use Healy's Rheumatic Liniment!

Are you subject to Cramps? Use Healy's Rheumatic Liniment!

And for the cure of Cuts, Burns, Sprains, and the bites of poisonous insects, it has no equal in the world. A sure and permanent cure guaranteed in every case. "Healy's Rheumatic Liniment" is stamped on the cork, and the fac simile of FRANK HEALY'S signature on the outside wrapper of the bottle. Wholesale Agents—Crane & Brigham, and R. H. McDonald & Co., San Francisco; and at retail by all respectable Druggists and Grocers. Price, \$1. 2v14t-10p

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF

FLAT &amp; ROUND WIRE ROPE.

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-third the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hempen rope.

We manufacture of all sizes, and in any length—  
Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope— " " " " " "

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one-third the weight of hempen of equal strength, (owing to freight for remote localities), suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For ships' Rigging, Derrick Gears, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$ -inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hempen Rope, and Chain.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 2v13 6m9p

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Bag, screw and Drop Presses, Coning Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**ROLLERS.** Locomotive, Flat, Tabular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are first replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Oearing, Chile Mills, Settlers of all descriptions, Rectorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BOKING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

**PRESERVATION OF WOOD.**—An effectual means of securing the non-destructibility of wood, has long been considered a great desideratum. Various plans have been proposed, chiefly on the plan of injecting salts into the pores, but most of these are too expensive for ordinary use. Of late, *char-ring* has been considered the cheapest, and on the whole the best plan. M. de Lapparent, the French director of naval constructions, has proposed to prevent the decay of the wooden parts of vessels, caused by the introduction of steam engines, by carbonization, using therefore a jet of flame directed and applied by compressed air. His apparatus is extremely simple. Two tubes of india rubber, one leading from a reservoir of ordinary gas, the other from a bellows worked by a treadle, convey into a copper tube simultaneously both the gas and compressed air. As soon as the mixture is inflamed, a temperature sufficient to melt metals is obtained. This is simply an improved Bunsen burner made portable. Keeping the bellows in action with the foot, all that is required is to direct the mouth of the copper tube with one hand against the surface of the wood in position, when it will be charred rapidly and uniformly. This process has been adopted in the French arsenals. Entire ships have thus been carbonized. Until recently there was a difficulty in applying this process except in towns supplied with gas for illumination. A son of M. de Lapparent has overcome it by using a portable lamp so constructed as to burn common and cheap hydro-carbons. The oil is conducted by a single cylindrical wick of large diameter placed horizontally at the side of the reservoir; in the center of the wick is a pipe communicating with a pair of bellows worked by a treadle; a metallic chimney, pierced with holes at its base, completes the apparatus, which produces a flame quite as intense as that of the gas burner. With this arrangement an operator can carbonize about twenty-seven square feet of oak, or twenty-two square feet of pine per hour, with a very small expenditure of oil. The French railway companies have availed themselves of the process and apply it to most of their wooden structures. In this country crude petroleum can be made available for carbonization; and thus cheapened, the process should be applied in all cases where the durability of wood is of the first importance.

generally, made to order, and warranted to give perfect  
satisfaction in every particular.

23v12-3m

Owing to its general circulation, the MINING AND SCIENTIFIC  
PRESS has perhaps been as valuable and as useful to the  
mining interests as that noted paper, the London "Lan-  
cet," was to the medical profession, acting either as a  
scarifier when too great a plethora of mining bubbles pre-  
vailed, or as a styptic where dangerous bleeding of the  
pockets of the capitalists was concerned. [Copperopolis  
Courier, Oct. 13]

**METALLIC SPECTACLES.**—M. Melacius has made a useful application of M. Foucault's recent discovery of the fact that the sun may be viewed through a lens covered with silver leaf. Foucault having shown that the sun's disc, thus shorn of the fierceness of its beams, can be clearly and leisurely examined, Melacius made the first practical application under the following circumstances: Having been injured while making an experiment in the laboratory, his eyes were painfully affected by light. In this condition he had recourse to spectacles with black glasses, such as are used by engine drivers; over these he put green glasses, which answered pretty well; but on further experiments he found the best method was to use pale blue glasses covered with silver or gold leaf, and these he recommends to all persons troubled with weak eyes.

and is practiced in saving sulphurets and the treatment of  
refractory ores. Is prepared to furnish references for all  
the necessary qualifications of an intelligent, faithful and  
reliable quartz operator. Address  
F. M. SHAW,  
San Francisco, care Mining and Scientific Press. 14v13-1m

## CONNECTICUT

### Mutual Life Insurance Co.

The Largest Life Insurance Com-  
pany in the World.

ASSETS.....\$12,000,000.

### THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE  
Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Business,  
The Largest Income.

And as it obtains the LARGEST average rate of interest on  
its investments, and has had, through its whole history, the  
SMALLEST average expenses, it therefore affords in-  
surance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy

Holders during the current year is SIXTY PER CENT. of

the premium paid during the year ending 31st of January,

1866.

Insurance can be effected in this Company in all the

forms desired, and to meet all the contingencies to which

Life Insurance is applicable, among which forms are—

**Whole Life Policies,** by a continued annual life

premium.

**Whole Life Policies,** by TEN annual premiums.

**Endowment Policies,** by a continued annual

premium.

**Endowment Policies,** by a limited annual pre-

mium, for FIVE, TEN, FIFTEEN or TWENTY years.

**Endowment Policies,** made payable at any age

stipulated.

ALL POLICIES issued by this Company are either non-

forfeitable by their terms, or may be converted into those

which are so, at the option of the insured.

The Company offers all the advantages of a CASH or

NOTES Company. The assured are not required to give a

note in part payment of the premium, but may, if pre-

ferred, pay the first four premiums in cash after which their

dividends on Annual Premium Life, and Continued Pre-

mium Endowment Policies, will, if the past success of the

Company is continued, reduce their premiums ONE HALF.

When notes are given for Annual Life and Continued En-

dowment Premiums, no notes will be required after the

fourth payment, and the returned surplus—dividends—

will be applied as cash to the reduction of the annual

premium.

None but Unexceptional Risks Accepted; and

only upon ages between Fourteen and Sixty.

## Accidental Insurance!

### The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF  
all kinds, and death resulting from accident.  
In case death does not result from the injury, the insured  
receives a weekly compensation as long as he is disabled  
(not to exceed twenty six weeks).

### ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensa-  
tion of \$5.

\$10 will buy Policy for \$2,000, with weekly compensa-  
tion of \$10.

\$50 will buy Policy for \$10,000, with weekly compensa-  
tion of \$50.

### SHORT TERM POLICIES.

Policies will also be issued for any other amounts within  
the limits before stated, for periods of one to six months,  
at rates in tens of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

### GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by  
its Agents at Hotels and Ticket Offices through  
the country.

They make Insurance for \$5,000, and \$25 per week com-  
pensation, against Accidents of every description, Travelling  
or otherwise; good for one to six days, as required, at  
TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which  
cover only injury or death, the result of an "Accident to  
the Public conveyance in which the assured may at the  
time be traveling," but they are GENERAL ACCIDENT  
TICKETS.

### SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and  
other Ports. Rates varying with the season, and the voy-  
age to be taken. Information can be had of the Company  
or its Agents.

The Company has a PAID UP CASH CAPITAL OF  
\$250,000. One hundred thousand dollars deposited with  
Wm. BARKES, Esq., Superintendent of the Insurance Depart-  
ment of the State of New York, and the remainder securely  
invested in Stocks in the hands of the Company.

### INDUCEMENTS.

The rates of Premium are very low.

The Plan is so simple that any one can comprehend it

his workings.

No MEDICAL EXAMINATION is required, and those who

have been rejected by Life Companies, in consequence of

hereditary or other diseases, can effect Insurance in this

Company at a very small cost.

No better or more satisfactory use can be made of so

small a sum.

For Policies or further information, apply to

**A. D. SMITH & CO.,**

Central Agents for the Pacific Coast.  
Office, N. W. corner Montgomery and Sacramento streets  
San Francisco. 17v13

### To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

### Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

### New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & CO., Patent Agents.  
San Francisco, May 1st, 1866.

### Job Printing Press for Sale—\$250.

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, could be had for \$250, cash—lowest price. Warranted. Apply to DEWEY & CO., Mining and Scientific Press Office.

ENGRAVED TO ORDER.—Persons who desire to illustrate their individual establishments or business, should give us their orders for Engraving and Printing, and we will guarantee good work and reasonable prices.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest in our readers to warrant publication.

THE MINING AND SCIENTIFIC PRESS, published weekly, in San Francisco, California, by Dewey & Co., is one of the oldest and most valuable papers published in the "Golden City." Mining is its specialty, but it is full of a variety of scientific and valuable information. Subscription price \$ only \$5 a year.—[Philadelphia Mining News.

## Metallurgy.

**HENRY PICKEL,**  
CIVIL AND MINING ENGINEER,  
No. 111 South Sixteenth street, Philadelphia, Penn.  
Occidental Hotel, and No. 711 Mission street,  
25v13-1m SAN FRANCISCO, CAL.

**BOALT & STETEFELDT,**  
Metallurgists and Mining Engineers  
AUSTIN, NEVADA.  
Western Branch of ADELBERG & RAYMOND, No. 90  
Broadway, New York. 11v11

G. W. MAYNARD, J. H. TIEMANN,

**MARTIN & CO.,**  
Office, Stevenson House,  
Corner California and Montgomery streets (up stairs)  
WILL CONTRACT FOR THE  
**PURCHASE OF COPPER ORES.**  
Assaying eight per cent, and upwards of Copper to the ton.  
We will make advances upon Ores of Copper.  
San Francisco, Post Office Box 1259. 22

**EUROPEAN**  
**METALLURGICAL WORKS,**  
—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at  
tended to. Sulphurets, pyrites, and the so-called "refractory  
ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the humid and dry way.  
Also, refining by cupellation, done at moderate rates.

**PRACTICAL MINING SCHOOL.**  
The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, grinding, and smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.  
S. P. KIMBALL, J. R. MURPHY,  
10v10

**MOSHEIMER'S**  
**Metallurgical Works**  
And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLUR-  
gical Works, and is prepared to reduce any kind of Ores,  
by smelting, Amalgamating, or other processes, that the  
nature of the ore may require.  
Practical Instructions given in Assaying, all branches of  
Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz  
Mills, Smelting and other Reduction Works.  
Having carefully studied the science of Concentrating  
Ores, I can offer better concentrating machinery than any  
in use in California, and especially such as will save the  
fine or floating gold and sulphurets.  
CONSULTATION OFFICE:  
423 Washington street, San Francisco.  
J. MOSHEIMER,  
26v13-3m Engineer and Metallurgist.

**City College Laboratories,**  
Southeast Cor. Stockton and Geary sts.  
Practical and Analytical Chemistry  
and Metallurgy.

**THOMAS PRICE,**  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALI-  
tative and Quantitative Analysis and Assaying. The  
course qualifies students for the application of Chemistry  
to METALLURGY, MANUFACTURING ARTS, and MINING  
PURPOSES.  
PHARMACEUTICAL and TECHNICAL CHEMISTRY,  
such as is required by Medical and Pharmaceutical Stu-  
dents, will be taught to such students as may require it.  
Course of General Chemistry.

Evening Lectures will be delivered every Tuesday,  
at half past seven o'clock, P. M., in the Philosophical Hall of  
the College, without extra charge to the students in the In-  
stitution.  
On and after the 14th of February, the Laboratories will  
be open every day, except Sundays, from 8 A. M. to 5 P. M.  
For further particulars, address  
REV. P. V. VEEDER  
Principal of the City College.  
6v12-20wtf Or at 406 California Street.

**PATENT BUSINESS.**  
We have lately associated with us in the Patent and Me-  
chanical Department of the MINING AND SCIENTIFIC PRESS, a  
gentleman of superior ability and attainments, who has  
arrived direct from the leading patent agency in New York  
City, and having a faithful and reliable associate in Wash-  
ington City, we are now better than ever before prepared  
to secure the claims of our applicants, in a careful, prompt  
and efficient manner.  
DEWEY & CO.,  
San Francisco, June, 1866. Patent Solicitors.

A splendid paper, and should have a good list of sub-  
scribers in prosperous Grass Valley.—[G. V. National

## New Mining Advertisements.

**Julita Gold and Silver Mining Company, Storey**  
County, Nevada.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the tenth day of Janu-  
ary, 1867, an assessment of one dollar (\$1) per share was  
levied upon the capital stock of said Company, payable  
immediately in United States gold coin, to the Secretary,  
607 Washington street, San Francisco, Cal.  
Any stock upon which said assessment shall remain un-  
paid on the sixteenth day of February, 1867, shall be deemed  
delinquent, and will be duly advertised for sale at public  
auction, and unless payment shall be made before, will be  
sold on Wednesday, the sixth day of March, 1867, to pay  
the delinquent assessment, together with costs of adver-  
tising and expenses of sale. By order of the Board of  
Trustees.  
A. NOEL, Secretary.  
Office, 607 Washington street, San Francisco, Cal. 1a12

**North San Francisco Homestead and Railroad**  
Association, at the City and County of San Francisco, Cal.  
Notice is hereby given, that at a regular monthly meeting  
of the Board of Trustees of said Company, held on the  
eleventh day of January, 1867, an assessment of twelve dol-  
lars and fifty cents (\$12.50) per share was levied upon the  
capital stock of said Company, payable January twelfth,  
1867, in United States gold coin, to the Secretary, at the  
office of the Association, No. 418 California street, Room No.  
5, third floor, San Francisco, California.  
Any stock upon which said assessment shall remain un-  
paid on the twelfth day of February, 1867, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Monday, the eleventh day of February,  
1867, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.  
GEO. W. KINNEY, Secretary.  
Office, No. 418 California street, Room No. 5, third floor.  
1a12

**Oxford Beta Tunnel and Mining Company, Es-**  
meralda District and County, State of Nevada.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the fifth day of Janu-  
ary, 1867, an assessment of fifty cents per share was  
levied upon the capital stock of said Company, pay-  
able immediately, in United States gold and silver coin,  
to the Secretary, or to the Superintendent at the mine.  
Any stock upon which said assessment shall remain un-  
paid on the fourth day of February, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made be-  
fore, will be sold on Monday, the fourth day of Febru-  
ary, 1867, to pay the delinquent assessment, together  
with costs of advertising and expenses of sale. By order of  
the Board of Trustees.  
GEO. H. PEEK, Secretary.  
Office, corner Broadway and Sansome streets, San Fran-  
cisco. 1a12

**NOTICE.**  
The following resolution was passed at the meeting of the  
Board of Trustees of the Ophir Silver Mining Company,  
held this day:  
Resolved, That the resolution of this Board, passed at the  
meeting held December twenty-fourth, 1866, providing for  
the levying of an assessment of five dollars per share on the  
capital stock of this Company, (on account of informality,) be  
and the same hereby is rescinded.  
ROBERT GEORGE, Secretary.  
Office Ophir Silver Mining Company, San Francisco, Janu-  
ary 10th, 1867.

**Assessment Notice.**  
**Ophir Silver Mining Company—Location of**  
Works, Virginia District, Storey County, Nevada.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the tenth (10th) day  
of January, 1867, an assessment of five (\$5) dollars per  
share was levied upon each and every share of the capital  
stock of this Company, payable in United States gold coin,  
on the fourteenth instant, to the Secretary of this Com-  
pany, at the office of the Company, Nos. 4 and 5 Court Block,  
corner of Montgomery and Jackson streets, San Francisco,  
California.  
Any stock upon which said assessment shall remain un-  
paid on the fourteenth day of February, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made be-  
fore, will be sold at public auction on the first day of  
March, 1867, to pay the delinquent assessment, together  
with the costs of advertising and expenses of sale. By order  
of the Board of Trustees.  
Office Ophir Silver Mining Company, Nos. 4 and 5 Court  
Block, corner of Montgomery and Jackson streets, San Fran-  
cisco, California.  
ROBERT GEORGE, Secretary.  
January 10th, 1867. 1a15

A. C. Treachy ..... 371 145 438 00  
And in accordance with law, and an order of the Board of  
Trustees, made on the fourth day of December, 1866, so many  
shares of each parcel of said stock as may be necessary, will  
be sold at public auction, by Messrs. Olney & Co., 415 Mont-  
gomery street, San Francisco, Cal., on the twenty-second  
day of January, 1867, at the hour of 12 o'clock M. of said  
day, to pay said delinquent assessment thereon, together  
with costs of advertising and expenses of sale.  
E. C. McCOMB, Secretary.  
Office, No. 1 Government House, corner Sansome and  
Washington streets, San Francisco, Cal. 1a15

**George Washington Gold and Silver Mining**  
Company.—Location of Works: Silver Mountain District,  
Alpine County, Cal.  
Assessment No. 16.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the thirty-first day  
of December, 1866, an assessment of one dollar and fifty  
cents (\$1.50) per share was levied upon the capital stock  
of said Company, payable immediately in United States  
gold and silver coin, to the Secretary, at the office of the  
company, only.  
Any stock upon which said assessment shall remain un-  
paid on the ninth (9th) day of February, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made before,  
will be sold on Thursday, the fourth day of February, 1867,  
to pay the delinquent assessment, together with costs of ad-  
vertising and expenses of sale. By order of the Board  
of Trustees.  
A. G. WOOD, Secretary.  
Office, 333 Montgomery street, San Francisco. 1a15

**Great Central Mining Company—Location of**  
Works: Yuma County, Arizona Territory.  
Notice is hereby given that at a meeting of the Board of  
Trustees of said Company, held on the twenty-fourth day  
of December, 1866, an assessment of one dollar (\$1) per  
share was levied upon the capital stock of said Company,  
payable immediately in United States gold and silver coin,  
to the Secretary and Treasurer, at the office of the Com-  
pany, No. 302 Montgomery street, San Francisco.  
Any stock upon which said assessment shall remain un-  
paid on the twenty-eighth day of January, 1867, shall be  
deemed delinquent, and will be duly advertised for sale at  
public auction, and unless payment shall be made before,  
will be sold on Thursday, the fourth day of February, 1867,  
to pay the delinquent assessment, together with costs of ad-  
vertising and expenses of sale. By order of the Board  
of Trustees.  
O. D. SQUIRE, Secretary.  
Office, No. 302 Montgomery street. d23

**Household Copper Mining Company, Low Di-**  
vide District, Del Norte County, California.  
Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twenty-second day  
of December, 1866, an assessment of fifteen (15) cents per share  
was levied upon the capital stock of said Company, payable  
immediately in United States gold and silver coin, to the  
Secretary, at 603 Market street, San Francisco, Cal.  
Any stock upon which said assessment shall remain un-  
paid on the twenty-second day of January, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made before,  
will be sold on Friday, the eighth day of February,  
1867, to pay the delinquent assessment, together with costs  
of advertising and expenses of sale. By order of the Board  
of Trustees.

Machinery.

V. CUSHING, Agent

Purchase & Shipping of Machinery OF ALL KINDS.

Special attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to— Governor F. F. Low; C. T. Meador, Stockton; Jacob Underhill & Co., San Francisco; J. W. Stowe, Russell & Erwin Manufacturing Company; Office, No. 120 Front street, San Francisco.

HUNTER'S

IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ore will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor, 22v13-3m San Francisco.

VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sets made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY, 1v1 San Francisco.

BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION,

and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

19v12 416 Market street, San Francisco.

Notice to Miners,

Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved pattern, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,

8v13-1y Stove Store, No. 125 Clay street, below Davis.

Brodie's Patented Improvements

FOR THE TREATMENT OF

Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600  
No. 2—15-inch Crusher, capable of similarly putting through five to six tons per hour, \$850  
No. 3—18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion of the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: I feel it my pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium in the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866 the royalty charged for using the same will be raised to the sum of \$100 per Barrel.

A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

The drawing and full description of this machine will be found in the "Mining and Scientific Press," of Sept. 22d, 1866.

BRODIE & RADCLIFF, Express Building, 402 Montgomery street, San Francisco.

GLASGOW IRON AND METAL IMPORTING CO., No. 27 Fremont street, SAN FRANCISCO.

Begin to inform purchasers that they have just received a large stock of Glasgow and Staffordshire best refined Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes, CAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.

LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALLED AND UNRIVALED IN THE United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc. CALIFORNIA REFERENCED.—E. Stetson, Folsom; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; E. McMillan, Lexington Santa Clara County. Send for Circular to KNAPP & GRANT, Agents for California, 26v13-1yq 310 Washington street, San Francisco

Hunt's California Pump

Has all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years.

Good judges have examined and pronounced them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 23 Second Street and 110 Jessie Street.

Also, Tread Horse Powers, Pumping Frames for Brigat, Sweep Horse Powers and Frames, all in one frame, the horse to travel around the frame.

PRICES OF HUNT'S CALIFORNIA PUMPS.

No. 3—3-inch cylinder, 6-inch stroke, \$30 00  
No. 4—3½-inch cylinder, 6-inch stroke, 35 00  
No. 5—4-inch cylinder, 6-inch stroke, 45 00  
No. 6—5-inch cylinder, 8-inch stroke, 60 00  
No. 8—8-inch cylinder, 12-inch stroke, 90 00  
A liberal discount will be made.

For further particulars, send for Circular.

E. O. HUNT, 21v13f 28 Second and 110 Jessie streets, San Francisco.

J. MARSHALL, W. WYLLIE, GLASGOW IRON AND METAL IMPORTING CO., No. 27 Fremont street, SAN FRANCISCO.

Begin to inform purchasers that they have just received a large stock of Glasgow and Staffordshire best refined Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes, CAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.

Country Orders punctually attended to. 19v13-q

NITRO GLYCERINE.

Nobel's Patent Blasting Oil!

WE ARE NOW PREPARED TO SELL NOBEL'S PATENT Nitro Glycerine. The same is stored with Mr. C. S. SWENSON, at Michigan Bluff, Placer county, from where the Oil has to be received by purchasers.

Application to be made to Mr. C. S. Swenson, or to the undersigned.

IGNITERS AND CARTRIDGES!

For sale at the same place.

Mr. Swenson is willing, if desired, to show purchasers the mode of blasting, either at his own mine, Michigan Bluff, or at the places of purchasers.

Pamphlets, with minute instructions, will be presented to every purchaser or applicant.

BANDMANN, NIELSON & CO., 21v13 210 Front street, San Francisco.

FOR SALE!

QUARTZ AND MINING MACHINERY

ONE GARDNER'S THUNDERBOLT CRUSHER, LARGEST size and best quality; is entirely new, with all extras—with a large lot of other Quartz Machinery, including Engines, Pumps, etc.

COFFEY & RISDO 15v13

Just Published.

THE PHILOSOPHY OF MARRIAGE, BEING FOUR IMPORTANT LECTURES ON FUNCTIONS AND DISORDERS OF the Nervous System and Reproductive Organs, to be had by addressing and enclosing twenty-five cents, postage stamps, to Secretary PACIFIC MUSEUM OF ANATOMY, Montgomery street, San Francisco.

It contains correspondence from different sections, giving accounts of new discoveries in gold, silver and copper, and should be taken by every person that wishes to keep well posted on the developments of our State and the Territories.—Mountain Messenger

Vein Mining.

This class of mining is yearly attracting more and more attention, and the fact that it is necessary to go deep on our quartz veins, to properly develop their riches, is now generally conceded. Washoe has been a "good school" for the quartz miners of California, in which the necessity of deep mining has been well demonstrated. A few years ago Grass Valley was about as dull as Auburn is now, the quartz miners there having worked the surface rock, found near the water level barren spots, and concluded the veins had about given out; but the mining operations over the Sierras gave them "new ideas," and the rule is "go down on your ledge;" no richer quartz claims are to be found in the State than are now worked in Grass Valley, in Amador county, and other mining sections of the State, where deep mining has become the rule; According to an eminent mining engineer, the great and daily increasing value of mineral productions renders any light which can be thrown upon the principles involved in the formation of veins, and the working of them, very essential. No miner should expect to find, until the water level is met, the most productive portion of the vein; above that point, irregular masses of ore may be obtained, but no safe working estimate can be formed, nor any reliable results reached, until the work has progressed under water. The yield from very wet veins has always been the most productive, as the experience of all vein miners has proven. Before commencing work on a mine, a well digested plan of the work should be settled upon, and then never deviated from. By so doing, thousands of dollars would be saved.

The reason of unsuccessful quartz mining heretofore, in our vicinity, has been the insufficiency of capital. Quartz mining requires an abundance of capital, with considerable patience and perseverance. No mine can be worked successfully without an expenditure of many thousands of dollars. And then there are so many delays that cannot be avoided, so many additional items of expense that could not be foreseen, that liberal calculations should always be made as to amount needed in properly opening a mine.

Many of the mines of Europe, Mexico, and South America have been worked to extraordinary depths, and generally proved rich. Humboldt speaks of a number of them over 2,000 feet deep, worked for centuries and paying millions of dollars. These are facts that our quartz miners should bear in mind, and be guided by, in developing their leads.—Placer Herald, Jan. 5th.

LABOR AND CAPITAL.—A "union of interests" between the employer and the employed, is now beginning to be considered the true policy in England. The London correspondent of the New York Tribune says:

In the iron, the cotton and the woolen trade, there are numbers of the ablest and most successful masters inquiring into the practical working of the "partnership of industry," and not a few actually converting their works already into such partnerships.

Even a year ago I felt that I must run for a straight waistcoat for any one who should have prophesied that the principles of "fixed payment on capital," and "a share to every laborer in profits, proportionate to his earnings," would have made such way and obtained such powerful and able converts by this time.

Unless some very unforeseen accident happens, the co-operators will have the ball at their feet in England in another ten years. There is scarcely one really thoughtful politician I know, who is not thoroughly in favor of the present development of what used to be called socialism.

VEGETABLE SOAP.—Mr. Payne recently brought from China to Europe specimens of the vegetable soap used throughout that Empire. It is in the form of pods produced by two leguminous plants. Before using these pods for washing, the Chinese first cut away the greater part of the epicarp, and then rub the wet linen with the pod thus denuded; after which it is enough to rinse the linen in fresh water.

TO DETECT SULPHURIC ACID IN VINEGAR. A German journal publishes a neat process, which may be thus briefly stated. Into the vinegar to be tested, put a small quantity of starch, boil the solution down to half its original measure, then drop into it a very minute portion of iodine. If the vinegar is pure, the usual blue tint will be shown; but if it be adulterated with sulphuric acid, no such coloration will take place, because the action of this acid upon starch converts it into glucose or grape sugar.

**A CHANCE FOR SPECULATION.**—In Santa Cruz county, on the ranch of Harry Love, near the San Lorenzo, eight miles north of town, is an immense mountain of pure white flint sand, containing a larger proportion of silica than any other sand, so far as we know, yet discovered in the State. The deposit is inexhaustible, and has none of the indications of sea-sand, thrown up by the fretful waves, but more resembles pulverized quartz of a calcareous or argillaceous nature, in the exact proportions necessary to make all the finer qualities of Flint, Sevres and Bohemian glassware, now in general use and commanding such a high price in the markets of the world. This valuable deposit of sand has been known for several years, and has been tested by competent glass-blowers who pronounce it superior to the article in general use. The deposit is within half a mile of the river, where ample water power for pressing and grinding plates, of largest size, could be easily and cheaply procured. The land could be bought at a nominal price, and there is sufficient timber to burn charcoal (which is more desirable than stone coal in flint-glass manufacture) for the works for last centuries. Capitalists should examine into this matter and invest, as there is no enterprise so certain to return large profits as the one proposed.—*Santa Cruz Sentinel.*

THE REESE RIVER REVELLE thus winds up an article in ridicule of those who point to the idle mills and the "gopher holes" about Anstin as proof that the mines are valueless:

The mining property of the district was never in so good condition as at present. It is being generally managed by capable men, who have had experience in mining, and intelligent system is now the rule. The plan of mining pursued on Lander Hill is not surpassed in this State or in California. Let any person who doubts this assertion visit such mines as the Savage, Great Eastern, Timoke, Buel North Star, Magnolia, Florida, Morgan & Muncey, North River, and the Oregon, North Star and Southern Light of the Manhattan Company, on Lander Hill, the Camargo and Whitlatch Union in Marshall Canon, and the Chase and Metacom in New York Canon. These fifteen mines alone are sufficient to maintain a town of the first rank. In our deliberate judgment, the product of silver in the Reese River District before the lapse of ten years will not be excelled by any district in this State.

A MISSOURI hunter, it is reported, found, the other day, a keg in the washed banks of a ravine which empties into the Mississippi, a short distance below Wolf Island. It was heavy, and he dashed in its head. It contained over \$30,000 in gold and silver coin. It is supposed that it was placed there by some one who fell in the late war of the rebellion.

SEA-WATER from Dieppe is quite an article of trade in Paris. Large quantities are used for baths and for aquaria, which last are fashionable there.

## MELLVILLE C. KEITH, M. D.

Homeopathic Physician,

## Baldness! Baldness!!

CAN BE PREVENTED, BY USING

## Mayhew's Balsamic Hair Stimulant!

THIS REPARATION HAS BEEN USED AND RECOMMENDED by some of the most prominent members of the medical profession of this city.

For the removal of DANDRUFF, SCURF, for preventing the Hair from falling off, and for producing a new growth, IT IS WITHOUT A RIVAL.

For particulars and references, see circulars accompanying each bottle. Prepared by

W. E. MAYHEW, Druggist,

N. W. Corner Fourth and Howard streets San Francisco.

He gives his personal attention to the preparation of Physicians' prescriptions.

Also, has constantly on hand a choice assortment of French, English and American Toilet Articles 16v13-6w

## IMPORTANT

## WORKERS OF GOLD & SILVER ORES.

THOSE INTERESTED WILL FIND IT TO THEIR ADVANTAGE to call on Mr. WILLIAM SLOSSON, at Prof. W. P. Blake's Office, and obtain a Business Circular, just published by the WURTZ AMALGAMATION COMPANY, of New York, who have secured, under the Patents of Prof. Henry Wurtz, the sole and exclusive right to the use of sodium in amalgamation. Mr. Slosson is prepared to supply the licenses of the Company, with the material for applying this new and wonderful discovery, by which, in the words of President Bernard, of Columbia College, "two grains of gold may be gathered where but one was before." 19v13-2m

**Economy in Advertising.**—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

## HALL'S SARSAPARILLA,

YELLOW DOCK AND IODIDE OF POTASS.

THE BEST BLOOD PURIFIER KNOWN.

Persons that are troubled with Rheumatism, Scrofula, Neuralgia, Morbid Liver, Salt Rheum, Pimples, Bolls, or any of the many diseases that originate from Impure Blood, would find it much to their advantage to give this justly celebrated article a trial. One or two bottles are quite sufficient to convince the most skeptical of its merits. It contains neither Spirit, Arsenic nor Mercury, which cannot be truly said of any other preparation called "Sarsaparilla."

SHEPARDSON & GATES, Prop'rs,  
N. W. cor. Sansome and Commercial sts.

22v13-3m

## TRUSSES! TRUSSES!!

Abdominal Supporters!

Shoulder Braces, Etc., Etc.

WE WOULD CALL THE ATTENTION OF DEALERS and others to our complete assortment of these goods, including Bartlett & Bunnell's Celebrated BALL AND SOCKET REVERSIBLE TRUSS, which is decidedly the best article ever introduced into this market. By a combination of the movement of the ball and socket, and the movable arm, any desired angle may be obtained. Call and examine for yourselves. A liberal discount to the trade.

SHEPARDSON & GATES, Agents,  
Corner Sansome and Commercial streets.

## Rheumatism!!

Still Another Witness!

LATHROP, Cal., Sept. 19, 1866.

(White Oak Township, El Dorado Co.)

This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than a slight and temporary relief.

About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably puts it to flight. I therefore cordially recommend it to the afflicted as an untailing remedy for Rheumatism.

FRED'K FABER.

DR. RICHARD'S REMEDY is for sale by

H. BOWMAN, Druggist, Sacramento.

And by Druggists generally.

## COLLIERY EXPLOSIONS—THE DAVY LAMP.

The late disastrous colliery explosions at Barnsley, England, was one of the most disastrous on record. For the course of fully a century, the scientific men of England have been laboring to devise ways and means to prevent the occurrence of these terrible calamities. Very superior means of ventilation were at first resorted to; but with only partial success, and one after another the deepest and most dangerous coal mines had to be abandoned. The introduction of the Davy Lamp, however, in which the flame is confined within a covering of wire gauze, seemed at first to promise immunity from such danger, and many abandoned mines were once more put into active operation. Time passed on; explosions continued, and in 1849, thirty-three years after the introduction of the Davy Lamp, a careful tabulation of such accidents for sixty years, astonished the public with the fact that more lives had been lost during the thirty years in which the Davy Lamp had been used, than during the same period next preceding its introduction.

The increased extent and risk of mining operations at that time, however, added to the well-known safety qualities of the lamp, rendered it quite certain that without the lamp many more lives must have been lost, than were then enumerated. A summing up at this time would probably present quite as unfavorable a result as did that of 1849.

But has the safety lamp really disappointed the expectations of science, or betrayed the confidence which has been placed in it for the last fifty years? Not at all. It has never yet been shown, in any one case, that the Davy Lamp has proved treacherous to its trust, or ignored the deductions of science. Thus far, in every case where the facts with regard to the causes of the explosion have been attainable, it has been shown that either carelessness, ignorance or wickedness have been the cause of the disaster.

A single mesh of wire, accidentally broken in a current of gas, may produce an explosion. It is often the case that sufficient gas will enter the lamp to cause a slow burning of the gas inside; which, if it increases, should be sufficient warning to the miner to leave the dangerous locality until additional ventilation should render it safe. Oftentimes, instead of doing so, the ignorant miner has endeavored to *blow out the flame*, instead of smothering it, or leaving with it. The effort to do so, has often resulted in forcing the flame through the wires, when an explosion has immediately followed. Lamps have often been carelessly opened in places supposed safe, and thus communicated fire to the gas. Lighting matches have not unfrequently produced the same casualty. A rapid movement of the lamp from one place to another has been known to cause an explosion by thus forcing the flame through the meshes; the same as though it was held in a strong current. Thus it is, by carelessness or ignorance, that nearly all the explosions in the English coal mines for the last fifty years have occurred. The lamp is an almost perfect protection when due care and vigilance is employed.

It is supposed, from certain circumstances brought to the notice of the coroner, that the late terrible explosion at Barnsley was caused by the careless handling of the lamp, in the manner last described. It is seldom that explosive gases are met with in other than coal mines, and in them only at considerable depths; hence we have thus far been free from such accidents in California—one or two slight ones only having occurred. As we go deeper in our coal mines, however, we should eventually be prepared to encounter this dangerous element.

ADAM SCHESSLER, of Yuba City, has 35,000 bearing vines on seventeen acres of land. Last year he made 12,000 gallons of wine and 300 gallons of choice brandy.

## Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada.

Fig. 1.

Fig. 2.

## Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a

## Premium Medal.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible without disconnecting the air-chamber, suction or discharge pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemppacking, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

## SUPERIOR DEEP-WELL PUMP.

No. 1—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.

No. 2—Cylinder, 3 inches; stroke, 7 inches; capacity 1,280 gallons per hour; weight, 89 pounds.

No. 3—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.

No. 4—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight 500 pounds.

No. 5—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

The Nos. 3, 4 and 5, are made to endure the

Fig. 2.

severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or 1am1S CUSHING & CO., Prop'rs, San Francisco.

## GREGORY YALE, Attorney and Counsellor at Law,

No. 18 Merchants' Exchange, (Battery and Washington streets).

Special attention given to obtaining Patents for Mining Lodes under the Act of Congress of July 26th, 1866; and Claims filed before the U. S. Registers and Receivers in any of the Land Districts in the State, and Contests before the Courts, under the Law, attended to. Opinions prepared upon all questions relating to Mining Laws. 1v14-1m

THE PRESS is a large, sixteen-page paper, and is truly a valuable assistant to the mining interests of the Pacific Coast.—[Nye County News.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, (which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, talcines, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for. 1v14-3m JAMES HITCHENS.

## The Pacific Chemical Works.

We took occasion, a few days since, to pay a visit to the Chemical Works of Messrs. Falkenau & Hanks. This is one among the numerous branches of industry which have recently been established in this city, and which are so suggestive of the progress that is now being made by the people of this coast. The Pacific Chemical Works were established about six months ago, the Laboratory being located on the corner of Center and Folsom streets, near the Mission. The works are quite extensive, substantial, and admirably arranged. The company is well prepared for every description of work pertaining to an analytical and manufacturing laboratory. Assays, analyses, and chemical investigations of every character are there made at the shortest notice. Pharmaceutical preparations, photographic chemicals, and all chemicals in general use in the arts and manufactures, are either kept constantly on hand, or made to order. Messrs. Falkenau & Hanks are also prepared to give advice upon all matters pertaining to technical chemistry.

The importance of an enterprise of this kind to our growing manufacturing industry is almost incalculable, to say nothing of the increased development of our home resources which it induces, through the manufacture of such chemicals as are required on this coast from the crude materials which abound within our own territory. Among the numerous articles of their manufacture, which are beginning to enter into general use on this coast, we noticed some very fine samples of cyanide of potassium, an article for which there is now a large demand among our quartz miners. Particular attention is paid to this especial branch of chemical manufacture, the great advantage in the use of which, in amalgamating operations, is beginning to be very generally understood. Their city office is at 629 Washington street.

**THE LAWS OF ARIZONA.**—We are indebted to Gov. McCormick for a full set of the Laws of Arizona, passed by the Territorial Legislature of 1864-5-6, properly indexed for convenient reference; the whole prefixed by the Organic Act of the Territory. They form a valuable addition to our library.

## Clegg's Counting House Ruler.

We give annexed a very simple yet useful form for a Counting House Ruler, or one which answers admirably for all ordinary purposes. It has been devised by Mr. D. Webster Clegg, of the Pacific Business College of this city. Its advantages are numerous—its disadvantages, none. Hence, it should be preferred to all other rulers. Among its advantages, in addition to those common to the ordinary rulers, we may mention its use as a paper-cutter, as a rule for measurement, and its adaptability for exact measuring of various distances, as usually required in ruling vertical lines for dollars and cents, or pounds, shillings and pence, or for thousands of dollars in the dollar column, to avoid the necessity of pointing off the numerical period, together with any desired and uniform width of parallel lines, etc. The under portion of the ruler is slightly concave, so as to avoid

CLEGG'S NEW PATENT COUNTING-HOUSE RULER.

blotting; the edges are also made beveled. By raising the ruler, as the work progresses, the bearings always come between the lines, so that the writer can rule backward or forward. The method of measuring off variable distances will be at once suggested to the observer, by an examination of the illustration herewith presented, which is done by placing the lower beveled rule-edge of the ruler to the edge of the paper or line already drawn, or the upper or lower edge to the two openings, as the case may require, which arrangement locates the ruler exactly in its proper position for drawing the next line, and so on. By varying the width of the ruler and the corresponding openings, any desirable variation of space may be readily attained. The saving of time, and uniformity and neatness of work, secured by the employment of this ruler must soon bring it into general use. The simple fact stated at the outset, that it cannot possibly have any disadvantage, inseparable from other rulers, and the possibility that it might possess some positive and peculiar advantages over those in common use, should be quite sufficient to determine the buyer in its favor in all cases. In the counting-house, in the school-room, and in the office of the professional man, it is equally serviceable. As a paper-cutter, with its natural handle, it excels all patented ones for that purpose. This ruler has been pronounced by those who have examined it, to be, without doubt, the *ne plus ultra* of rulers. It will soon be for sale by the trade generally, and can be made of wood, metal, or any other desirable material. Applications for a patent for the same have been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

## The Great Central Copper Mine—Arizona.

This mine is located on Williams' Fork, nine miles from the Colorado river, and about 1,000 feet from the celebrated Planet mine, which has been shipping ore to this city for some time past. It is thought by some to be on the same vein with the Planet; but the supposition has not yet been demonstrated. The mine is owned chiefly by San Francisco capitalists, and is under the superintendence of Mr. Wm. Thompson. Work was commenced upon it about three years ago, but until quite recently has progressed but slowly, in consequence of the unsettled state of the country, and the difficulties of transportation between this city and the Colorado. These difficulties, however, having now been measurably removed, active operations have been commenced, which have already resulted in most important developments.

According to the report placed at our dis-

**CONSULATE REQUIREMENTS.**—There is no position that Americans seem to covet so much as that of Consul to a foreign port. Applications for these posts are so numerous, and so frequently from persons totally unfitted to perform the duties of such an office, that the Secretary of State has issued a circular of instructions to applicants, setting forth the necessary requirements for such a position. In this circular, applicants are informed that they must be over twenty-one years of age, undoubtedly citizens, have taken the oath of allegiance, be able to write a good hand, thoroughly acquainted with arithmetic, geography, English grammar, bookkeeping and history, especially that of the United States. They will also be required to pass an examination in the Consular Manual, Kent's Commentaries, Story on the Constitution of the United States, and the text of Wheaton's Elements of International Law. They should also understand French, or some other European language.

**A NEW ROASTING FURNACE.**—Messrs. Agrell & Klepzig have devised a new roasting furnace, which is so constructed that the hearth is caused to revolve, while a set of stationary stirrers is made to so turn and distribute the mineral as to obviate any necessity for hand stirring. The stirrers are attached to a shaft which extends horizontally over the hearth, from which they may be readily removed by merely slipping them along over the end of the same, and taken out at the working door. The shaft is made hollow, the better to withstand the action of the gases, and to allow of the application of steam, if thought desirable. The furnace is charged through hoppers upon its top in the usual manner, and requires no attention after the charge is placed upon the hearth until it is ready for removal, except the tending of the fire. A drawing of one of these machines may be seen at the Pacific Foundry, on First street, which will be explained to any parties who may be desirous to examine into its principles. Applications for a patent for this invention has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

**THE CONSOLIDATION ACT.**—We have to acknowledge the receipt of a copy of this Act, "The Charter of the City and County of San Francisco; with other acts specially and generally relating to San Francisco, and the General Orders of the Board of Supervisors." It is compiled by T. Hart Hyatt, Jr., and published by the order of the Board of Supervisors. It has a complete and convenient index. It is not only indispensable to the lawyers and the law-makers of the city, but is a desirable addition to the library of the private citizen.

**THE MINING LAW** passed by Congress last July, has, as it happens, never been sent to the different U. S. Land Offices. Now that a change in the law is contemplated, it will probably not be sent to them until some action is taken.

The ores of this mine are oxyds and carbonates, very little or no iron or sulphur being present; hence the company is able to turn out at one smelting a very good article of copper. Some of this copper has been used by the brass founders of this city, who have pronounced it a very fair article for many commercial purposes, just as it comes from the furnace. Within less than two months they will have a larger furnace in operation, which they think will be able to turn out from three to five tons of copper per day. The company own two parallel ledges of 3,600 feet each. Only one ledge has as yet been developed to any considerable extent. Upon this an incline has been sunk to the depth of one hundred feet, at which point there are some indications of sulphurets coming in. At the depth of about fifty feet drifts have been run each way from the shaft about one hundred feet, all the way in good ore—vein varying from five to seven feet thick. The shaft is also connected with the surface by a tunnel, through which the ore will be taken out. The outcrop of the vein has been stripped quite a distance, developing good ore all the way. The superintendent estimates that he has fully five thousand tons of ore opened to sight, which will average a yield of 25 per cent.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Rittinger's Ore Separating Boxes and Funnel Boxes.

Messrs. Editors:—In your issue of the 5th instant, I noticed an article headed "Rittinger's Funnel or Pointed Boxes." As Ritter Van Rittinger is a personal friend of mine, and, as I am, perhaps, better acquainted than any other person in this country with the machinery which bears his name, it may be of interest to your readers to learn who Ritter Van Rittinger is, and what he has done for the development of the mining interest.

Mr. P. Rittinger, who is now a baron and a privy councillor of the Emperor of Austria, was an official in one of the Hungarian mines, and while there acting as a superintendent of the crushing and concentrating works, studied thoroughly the modes of concentrating ores, as practiced at that time. His attention was first called to a separation of the ores, after being crushed, according to size. He was not only successful in his first attempt, but in all subsequent machines which he constructed for the purpose of concentrating ores. I may safely say there is no man that stands so high in the estimation of scientific men, in this branch of science, as Baron Rittinger. The Germans call him the champion of mining engineers. In order to form some idea of the extent and value of his inventions, I will state that I have all the drawings of the same, and I would decorate my office with them, but they are numerous that it would require three good sized rooms for their proper exhibition. I am willing to show them to any one who wishes to learn something about the science of concentrating ores—as it may save many experimenters much money, time and labor—I know it will not be a benefit to your Patent Department; but you may realize the benefits otherwise).

I will now come back to the original boxes or tanks which Mr. Rittinger invented in 1846, and which now, after a lapse of twenty years, are put up in Grass Valley as something new in California.

Rittinger's "Separating Boxes," and his "Funnel Boxes" are quite different machines; and not one and the same theory, as would seem to be implied in your notice thereof. The separating boxes were invented in 1846, and the funnel boxes only in 1862. In order to give a clear idea of the nature of the two machines, I will give you a description of both.

The first or original invention, as described in your paper, is the square box, pointed like an upset pyramid to the bottom; they are for the purpose of separating the ores as they come from the battery or stamps, according to size and gravity, in order to make them fit to go into the concentrator. You have given as intelligent a description as it is possible to write of their construction and *modus operandi*, and I trust that either an experienced man has been entrusted with putting them up, or that he will at least take the trouble to learn the true merits of the machinery. He will have a difficult task on his hand, as the people of this country are very impatient with such processes as concentration; and if a plan does not succeed at the first start, the introducer is at once condemned.

## RITTINGER'S FUNNEL.

Now, Messrs. Editors, to describe what is called "Rittinger's Funnel" (which is quite a different machine from the above), without a drawing, is difficult. Suffice it to say, it is nothing more nor less than an ordinary funnel of from two to four feet in diameter, with several other smaller funnels inserted within the first. It is a stationary machine, and requires no motive power to drive it.

The machine is not expensive to build, and is especially adapted for separating the finest slimes. No machine has ever been contrived which is better adapted for collecting the fine floating gold than Rittinger's Funnel.

A leading object with our miners ought to be concentration, as by it alone they are able, in the old countries, to work the poor ores. It is astonishing as well as melancholy to see how most of our mills lose from twenty to fifty per cent. of the gold contained in the ore, while, after the stuff has been already crushed, it costs a mere trifle to save nearly all the gold. We do not need to wait for any new inventions in concentrating machines; machinery has already been invented that does the work as thoroughly as we can hope to see it done—machinery which can be relied on. When we have those machines at work properly, and wish to improve, then will be the time for inventions. In Austria they save 94 per cent. of the metal and sulphurets by concentration, and that from poor ore. Can any mill here say they do the same? I believe not.

Let us candidly ask what has ever been invented in California in the way of concentrating machines? Is there any that does the work of saving near ninety per cent. of the sulphurets? If there is any such machine, I would like to see it. In my opinion, the merits of all the machines constructed here may be very quickly summed up. They save some of the loose sulphurets, but most of the fine and valuable portions go to waste. These so-called inventions have generally been devised by men who are not experienced in this science. They all attempt to save the sulphurets without a previous separation, according to the size of the particles. Ore can never be concentrated without being properly sized beforehand.

It may be asked why have none of these European inventions ever been introduced here, if they can save 90 to 94 per cent. of the sulphurets? The answer is that California miners are very much like the miners of Cornwall. In 1862 I traveled with Baron Rittinger through Cornwall and Wales. I offered to a mining company to erect works at my own expense for crushing and concentrating, if they would divide the savings of labor with me. The superintendent, who was a part owner in the mine, laid my proposition before the meeting of the Board of Directors, and the answer was, "as long as our mines pay a dividend, we don't make any improvements or alterations," and this seems to be exactly the case in California, and especially in Grass Valley.

It is often very interesting to hear people talk of our great mines and reduction works, as if there had never been anything like them in the world. A little more moderation and inquiry would convince them that where people have worked gold and silver ores for the last thousand years, a little more experience has been gathered than has been acquired during the short time in which Californians have been engaged in mining.

Another point to sustain my statement is, that there is not a single manufactory of concentrating machinery in California, while on the Rhine, near Cologne, there were two factories, each employing about 200 men, for the sole purpose of manufacturing mining concentrating machines, *not one of which is now in use in this State*. The same machines made in the factories named I introduced in England, and they are successfully working there to this day; while in California they are waiting for something extraordinary to turn up. Californians seem determined to have original inventions, no matter whether the previous ones are good or not, and while we are waiting for something new, we are continually losing at least thirty per cent. of all the gold produced.

We have any amount of mines, rich in gold, which lie idle for the want of proper machinery to save the gold; but I assure you, Messrs. Editors, there is no difficulty in accomplishing that object, if the gold is only contained in the ore. I hope the people in Grass Valley may be successful with the trial of the Eureka, and give an example to the whole State, even if they are not the first ones who put up Mr. Rittinger's separating boxes, as stated in your last.

J. MOSHEIMER,  
Engineer and Metallurgist.  
San Francisco, Dec. 7th, 1867.

THE Legislature of Washington Territory offer suitable rewards in favor of adventurers who shall discover gold mines of a profitable and enduring character.

A SINGLE copper nugget, weighing 15,000 pounds, was recently brought from the Lake Superior region to Pittsburg.

[Written for the Mining and Scientific Press.]

## Partzite—A New Mineral.

[By ALBERT ARENTS, Mining Engineer and Metallurgist.]

This mineral was discovered early in the year 1865, in the Blind Spring Mountains, situated in Mono county, California, and first denoted as a silver ore, by Dr. A. F. W. Partz, for which reason I have applied to it the above name.

It has hitherto never been found in crystals or of a crystalline structure, but always in amorphous masses, generally without luster, and rarely of a glistening appearance. Its fracture varies from conchoidal to even, and its color from yellowish-green to blackish-green, and black; the lighter-colored portions containing the most silver. Oftentimes the mineral has considerable resemblance to the product obtained during the middle of the raking period in cupellation. The amount of silver it contains ranges between four and twelve per cent.

In the veins of the Blind Spring District, the Partzite occurs in irregular deposits, which are often nodular in shape, and occasionally occupy, for a distance of many feet, the whole width of the veins.

Its Sp. Gr. is 3. H.=3-4. Before the blow-pipe, on platinum, it is smelted, but with difficulty, to a black slag; on charcoal, and especially by adding soda and pulverized charcoal, a metallic button is easily obtained, which bears much resemblance to pure antimony.

So<sup>3</sup>, C H and No<sup>3</sup> decompose the mineral, even in the cold, evolving oxyd of antimony and forming a copper-silver solution.

An analysis of the mineral showed the following composition:

	Relation of Oxygen.	Relation of Equivalent.
SbO <sup>3</sup> = 47.65	7.47	7.47 ÷ 24 = 0.311 = 1
CuO = 32.11	6.47	
AgO = 6.12	0.42	
PbO = 2.01	0.14	7.54 ÷ 8 = 0.942 = 3
FeO = 2.33	0.51	
HO = 8.29	7.37	7.37 ÷ 8 = 0.921 = 3
	98.51	

From the above it will be seen that for 1 eq. of acid there are 3 eq. of bases, and 3 eq. of water. We thus obtain the following formula:

Of arsenic but slight traces were detected, which, however, in all probability were due to the presence of fine reticulations of a brilliant green color, by which the mineral is more or less interwoven.

The Partzite occurs, together with argentiferous galena, in veins of a magnitude varying from nine inches to eight feet, and has already become the object of extensive mining operations.

THE GREAT CHICAGO LAKE TUNNEL, for supplying water to the city of that name from Lake Michigan, is now completed, and the inhabitants are congratulating themselves over the prospect of an early supply of pure water. This tunnel may be considered as among the boldest engineering feats of modern times. It has been pushed out under the lake, through a strata of firm blue clay, for a distance of two miles. It is secured by brick walls laid in hydraulic cement, and is elliptical in sectional form. The water is taken from the lake at a depth of thirty feet. It will be made available as soon as suitable reservoirs can be made, into which the water will be pumped for supply of the service pipes. The urgent necessity for that work may be inferred from the following paragraph which we clip from the Chicago Railroad Gazette:

The only universal regret is that it cannot be speedily put to practical use, for water fit to drink was never more needed than now. The pipes are full of stinking fish and decomposed substances of various kinds, and the city is suffering from a nuisance that an impossible number of filters can alone abate. The sooner it can be got in working order, the better for the health and comfort of the city. There may be "water everywhere," but there surely is "not a drop (fit) to drink." Give us the pure lake water first, and celebrate afterwards.

## The Chloride of Sodium Process.

Mr. J. K. Wyckoff, formerly of Georgia, is now working ores at his reduction works, foot of North Third street, Brooklyn, by means of his recently patented chloride of sodium process. The machinery used consists of a wooden cylinder—like the old Indian tree-cradle that many of our California readers will remember—and a shaking table, with the ordinary mechanical appliances for working them. The process is as follows: Two hundred pounds of finely crushed ore is put into the cylinder or amalgamator, with about one hundred pounds of mercury and sixty gallons of water, to which three per cent. of salt is added. The cylinder is then set in motion, rocking backward and forward. Steam is now let in through a pipe, and in about eight minutes the water boils, and the mercury permeates the entire mass. Forty-five minutes having elapsed, a stream of cold water is let in, which suddenly cools the mass and precipitates the mercury. The gate at the end of the cylinder is then opened, and a stream of water run through the cylinder, until it comes clear, when the gate is closed and a new charge is put in—the mercury still remaining in the cylinder. The shaking table at the end of the cylinder is simply to work the debris, and retain whatever mercury may come over with it—which is found to be very trifling. It is claimed that the results produced by this process of amalgamation are wonderful—many of the most refractory ores of Colorado, California, Virginia and North Carolina have been worked and made to produce from \$100 to \$1,300 per ton; that such results as are afforded by his process cannot be produced by any other; and that in many instances the tailings of other processes have been thus worked by him and made to yield astonishing results. We all know that particles of gold, when fine enough, will float in water and even in the air, and that much of it is lost by the old process. All this wastage Mr. Wyckoff declares he can obviate by his chloride of sodium plan of amalgamation. Our readers can, however, judge for themselves.

We clip the above from the American Journal of Mining, of New York, of June 16, 1866; which paper, also, contained an illustration of the machine. In a subsequent edition of the same paper the editor says:

Some months ago we illustrated and described a "chloride of sodium process," which many years ago had been stumbled upon in the course of some experiments made by Mr. John Wyckoff, at his gold mines in Virginia, and since tested by him to a very considerable extent. We have recently heard more of it, viz.: that it has been tried at the Holman mill, Black Hawk, Colorado, by Professor Bradford, who found that the tailings of that mill yielded from \$100 to \$500 per ton by this process; that Engineer Aitken has tried it in Montana, and found it produced from the rock he tested an average of \$400 per ton; some of it going as high as \$8,000; that number of scientific gentlemen, as well as many practical millmen, have taken ores to be treated at Mr. Wyckoff's Reduction Works in Williamsburgh, and after working them in batches of 200 pounds to the charge, with their own hands, have been absolutely startled at the results; and that some thirty mining companies, operating in different parts of the country, have decided upon adopting it. Many of the miners and millmen will probably doubt whether such results can be obtained as Mr. Wyckoff's books show, for they are really marvelous, but let them take 200 pounds of ore with them, and their own quicksilver and salt, and manipulate the batch with their own hands at his works, and they will probably be as much astonished as was our friend Dr. Stevens, who tells us he obtained by this process double the yield given by any other.

FLAXSEED IN OREGON.—Last year, twelve hundred bushels of flaxseed was raised in Oregon by the Pioneer Oil Company. This has all been loaned by the company to the farmers, on condition that the crops of this year should be sold to the company at the market rates.

HORACE GREERLEY offers to pay \$200 to the first and \$100 to the second township of not less than 100 houses that shall have at least two well planted, thrifty grape vines to each dwelling.

NINE thousand pupils in the Cincinnati public schools are taught German. The Teutonic is a large element in the population of that city.

## Mechanical.

## The Properties of Iron and Steel.

Notwithstanding the diversity of opinion with regard to the action of impact and vibration upon the atomic condition of iron, and although some experiments and well attested facts go to show that such action produces no unfavorable effect upon the crystalline condition of wrought iron, there is still another class of experiments and facts which seem to point, with an equal degree of certainty, to the contrary. Bearing this in mind, the following from Professor McGauley, cannot fail to be read with interest:

In considering the fitness of iron as a material for the construction of ships and bridges, and particularly for the latter, that one most dangerous defect to which wrought iron is liable, must be taken carefully into account, namely, its tendency to crystallize, and thus to lose a very large portion of its strength.

It appears from Mr. Fairbairn's experiments, that with constant changes of load, or with the same load, but with constant disturbance of the metallic molecules, from vibration, fracture will, in time, certainly ensue of itself.

It has been ascertained that an iron girder will break with about 400,000 changes of load, accompanied by vibrations; a fact which but too clearly shows that the spontaneous destruction of our iron bridges is but a question of time, and not even of a very long one.

The explanations of this very alarming fact, the danger from which is, unfortunately, not even confined to bridges, but extends to the axles of locomotives and carriages, and to the various portions of machinery which from time to time so unexpectedly give way, is found in the restoration to their primitive forms of the crystals which had been elongated and mutually entangled by the hammering to which the iron is subjected during its manufacture.

It might be supposed that steel, from its tensile strength being so much greater than that of iron, would be, in every instance, far preferable to iron. Such, however, is not the case. If, for example, steel is used in the formation of a girder, its thickness may be much less than if iron were used. But this very circumstance, as it is almost equally liable to oxidation, causes its strength to be impaired with much greater rapidity.

Thus, a plate of iron half an inch thick is much less weakened by oxidation to the depth of the sixteenth of an inch than a plate of steel, which at first is only a quarter of an inch thick. In the one case, the strength of the plate is diminished only to the extent of one-eighth; in the other, with the same amount of oxidation, to the extent of one-fourth. In the former case the plate would stand, when in the latter it would be sure to give way.

Again, it might be supposed that steel would answer best where violent concussions are to be withstood, and that, therefore, it would be an excellent material for armor plates. The reverse is, however, true. Steel is strong only when exposed to a force that is slowly applied. A cannon ball which would cause only indentations in iron, or, at the worst, merely pass through it, would dash a plate of steel to pieces, dealing destruction, most probably, to all those in its vicinity.

**DIVERSIBILITY OF IRON.**—Under the general name of iron are included virtually distinct metals, which, in external characteristics, differ far more from each other than some chemically distinct metals. The difference between the ductile wrought iron, the elastic steel, susceptible of receiving very different degrees of hardness by tempering, and the hard, brittle and *unforgeable* cast iron, depends on the difference in the proportion of carbon, though other elements often concur in modifying in a striking degree the qualities of this wonderful metal.

**STEEL RAILS.**—The London and North Western Railway company have already laid sixty-three miles of steel rails on the road, and the work of relaying with steel instead of iron, is to be continued. On the Great Northern Railway steel rails have also been laid at all the principal stations, and on the steepest inclines.

**INDIA-RUBBER RINGS** are now used in packing wine bottles in France. They slip over the bottles, and render breakage impossible. They can be used over and over again.

## A New Desulphurizing Furnace.

The *Denver News* of December 12th, describes a new desulphurizing furnace, lately devised in England, which has already been patented there, and for which application has been made for letters patent at Washington. The description is given substantially as follows, in a letter from Mr. R. O. Old, one of the pioneer miners of Colorado, now on a visit to England:

The principle involved in the furnace, is, that after the ore has been carefully concentrated and crushed, it is slowly but continuously sifted through a sort of hopper or feed box, on its top, so that every particle in passing through the same is so exposed to a heat of the requisite degree for desulphurization, that the metals are completely liberated from the sulphur.

The furnace is a vertical chamber, constructed of fire brick, fitting in which are a series of horizontal bars or barrels, also of fire brick, angular-shaped, with the base of their angles turned upward. These are for the purpose of intercepting and distributing the crushed ore, as discharged from the feed-box, in which the supply is regularly maintained in the passage of the same. By the turning of the bars flat edge up, the powdered quartz collects in heated, but distributed bodies, and rains over, so to speak, all the bars successively, like golden showers, falling through some fifteen or twenty feet of space, which, having filled up, assume a diamond shape, and which the nature and principle upon which the furnace is constructed renders necessary—the ore is collected below, thoroughly desulphurized and drawn out through a grate or hole in the bottom, arranged for that purpose.

But what is most curious about the furnace at first sight, and that which gives and adds materially to its value (economically considered) is that when first started to operating, it only then, and not afterwards, needs fuel—the sulphur in the ores being sufficient to supply all demands for combustion, and the keeping up of a continuous heat ever after, so long as there is a supply of ore, whether for a few hours only, or for years.

The writer, while on his visit to Swansea, reports having seen several of these furnaces in operation, desulphurizing Cornish and Chilian copper ores, and thinks them especially adapted for working the sulphureted gold ores of Colorado.

**RELATIVE COST OF HORSE AND STEAM TOWAGE ON CANALS.**—Considerable attention has recently been attracted on the part of English engineers to a practical experiment of steam towage, which has recently been made on the Gloucester and Berkeley ship canal, in England. The length of the canal is sixteen miles—level from end to end. Until within four years, horses have been employed for towing, at an average cost of one farthing per ton per mile. About four years ago, three steam tugs were fitted up to take the place of the horses. After running four years, 1,059,137 tons had been towed the length of the canal, sixteen miles, at a cost of \$32,000, including fifteen per cent. per annum for the cost of the tugs for interest, repairs, etc. A careful computation shows that this arrangement has effected a saving of *two-thirds* in the cost, as compared with the haulage by horses, with less damage to the canal than was caused by the horses. The speed attained by steam was from three to three and a half miles per hour. The experiment is pronounced a perfect success, and will probably be introduced upon other similar works in other parts of Europe. It is suggested, in view of the above results, that steam towage should be tried upon the Delaware and Raritan canals. There is little doubt but that a system of towage for freight might be most advantageously applied to the entire river and bay navigation of California.

**LIQUID FUEL.**—A steam yacht owned by Mr. Barfi, of Glasgow, has made two trips to Gravesend and back, propelled by steam raised with liquid fuel, without the use of an atom of coal.

**MECHANICS** have worked 600 years on the spire of the cathedral at Strasburg.

## Scientific Miscellany.

## Influence of Silica in the Formation of Vegetable Fiber.

We alluded last week to the fact, that the opinion, which is generally current, that it is from the lack of silica in its stalk that the spear of grain is weak and liable to fall down or "lodge," much to the detriment of the crop, has quite recently been controverted—that the suggestion so frequently thrown out that grain might be prevented from lodging by dressing the soil with some one of the soluble preparations of silica, and so furnishing to the growing plant the supposed desideratum in a readily assimilable condition, will not stand the test of chemical investigation. The subject is one so new and interesting, that we have clipped the following further particulars from an Eastern exchange:

The distinguished French agricultural chemist, Pierre, has recently subjected the whole question to the test of experiment. He finds that the ideas and hypotheses above mentioned are not borne out by facts. As the result of numerous analyses, he finds that of the different parts of the wheat plant the leaves contain far more silica than the smooth portion of the stalk, and the stalk much more than the knots or joints, which prove to be comparatively poor in silica, in spite of their apparent hardness. In equal weights, the leaves contain seven or eight times as much silica as the joints, and four or five times more than the spaces between the joints. The portion of the plant least rich in silica is the lower part of the stalk, at precisely the place where the stiffness and rigidity are most necessary. If, then, silicated manures be offered to the wheat plant, the larger proportion of the assimilated silica will accumulate in the leaves, it follows naturally that grain highly charged with silica might fall down and lodge, while grain exposed to similar conditions, but less rich in silica, might stand firm and suffer no harm.

It has long been noticed that, other things being equal, those samples of grain of which the leaves are most highly developed lodge first. This is not surprising for in this case the foot of the stalk remains shaded, and, as a consequence, soft and feeble, while the enervated stalk is forced to carry an excessive load, which presents a great surface to the crushing pressure of rain and wind. On the other hand, it is notorious that the wheat grown upon poor land rarely lodges, and the explanation of this fact is evidently that, in the absence of vigorous leaves, the stalks, besides having no great load to carry, become hardened by the action of sun and air.

The practical lesson suggested by these experiments is that, in order to prevent the lodging of grain, the farmer must, for the present at least, look rather to improved methods of sowing, by means of which light and air shall always be freely admitted to the stalks, than to any chemical specific which has yet been suggested. In the course of time means may perhaps be found to induce the deposition of strengthening ingredients at those parts of the stalk where strength is most needed, but until that time arrives it will be best to follow the lesson taught by the natural growth of the wheat plant, and not to depart too far from the physical conditions which are essential to its healthy development.

**COMPARATIVE INTENSITY OF LIGHT AS REFLECTED FROM THE MOON AND FROM VENUS.**—On the 20th day of June, 1865, at the hour when the moon and Venus were in conjunction at the city of Lyons, France, M. Chacornac made use of the opportunity to compare the relative intensity of the light reflected from the two bodies. The surfaces taken for comparison were those affording rays at the same angle of incidence; that on the moon was the regions lying between the craters Rocca and Eirehstadt, over the very brilliant surface which lies to the southeast of Grimaldi. It was found that this, the brightest part of the moon, reflected only one-tenth as much light as that reflected from the surface of Venus.

**WATER-PROOF BOOTS.**—It is said that a coat of copal varnish applied to the soles of boots and repeated as it dries, until the pores are filled, will make them water-proof and three times as durable as those not so treated.

## LIQUEFACTION OF CARBONIC ACID GAS.

When carbonic acid gas, at the temperature of the freezing point, is compressed with a power of forty atmospheres, or six hundred pounds to the inch, it liquefies—five hundred volumes being compressed into one. When raised to ordinary summer heat, or 90° F., its resistance is equal to 1,200 pounds to the inch, or double that of the freezing point—the same amount being compressed into the same space in both cases. Of course very strong machinery is required for this experiment; and the experiment is a very dangerous one when attempted by inexperienced hands or with imperfect machinery. A Parisian chemist, named Harvey, was killed while experimenting with the manufacture of this gas under high temperature; the iron cylinder which he employed burst like a bombshell, by the too rapidly developing gas. While the condensation of carbonic acid gas into a liquid, reduces its volume five hundred times, the condensation of common steam to a liquid (water) reduces its volume seventeen hundred times. We believe the only instrument on the Pacific coast constructed for the liquefaction of carbonic acid gas, is connected with the philosophical apparatus of the Catholic College at Santa Clara.

**AN IMPORTANT MEDICAL DISCOVERY** is reported by the *Medical and Surgical Reporter*, as having recently been made by one Augustus Barnes, which is certified to the *Reporter* by Dr. P. W. Ellsworth, of Hartford, Conn. Mr. Barnes, not being a member of the faculty, proposes to secure his discovery for his own use, by letters patent. According to the testimony of Dr. Ellsworth, he is able to remove spots, such as moles, naevi (maternal marks) and other diseased conditions of the skin, by the action of sunlight concentrated through a lens. Dr. E. vouches to having seen the operation on a naevus, covering four or five square inches of the face, of a deep cherry red color, approaching purple, and covered with knobs of condensed tissue an eighth of an inch high. After two applications, every knob had disappeared, the skin had gained a natural color, and, as a deformity, the naevus was practically cured. Mr. Barnes professes also to have removed small tumors, to have produced a true and healthy skin on the surface affected by ichthyosis, (a kind of scaly eruption), and to have high expectations in regard to incipient cancer. To what farther extent in the healing art, Mr. Barnes' magic lens may lead, has not yet been suggested.

**PHOSPHATE OF LIME.**—It is said that a discovery of a bed of natural phosphate of lime has recently been made in the center of the Estramadura, and on the direct line of the projected railroad which is to unite Madrid with Lisbon. The bed is of a mountainous form, very abundant, and easy to be worked by an open cutting. This mineral, known to mineralogists as *apatite*, has hitherto been discovered in only limited extent and in but few localities. Especially is this the case on this continent, where it occurs only in scattered crystals or nodules, or in narrow seams in the limestones, slates or granites.

**A USEFUL HINT** is given by a correspondent of an Eastern exchange, as follows: A tin tube, made like a syphon, driven into the vent of a barrel of wine, or cider, and the other into a bottle of water will prevent the air from entering the barrel, while the gas escapes through the water. Make the barrel otherwise tight. When the wine or cider is done working, the water in the bottle will cease bubbling. It requires no filling up, and there is no loss. I have tried it. The tube can be made by any tin-plate worker, and when once made can always be kept for future use.

**A SOLUTION** of chloride of copper is a test by which gilt articles can be distinguished from those which are bronzed. The latter are stained brown by it, while the former suffers no change.

## WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,  
January 19, 1867.

## CITY STOCKS.

Transactions in city shares have been limited during the present week, and for some time past this class of securities has exhibited little animation. We note several small sales of Pacific Insurance Company at 160, and National at 76½. The San Francisco Insurance Company paid a quarterly dividend of 4½ ¢ cent. for the three months ending with December last, and the California 6 ¢ cent. for the same period.

It appears from the annual statements of several of our home insurance companies that a strictly local business has not been very profitable during the year 1866. This is not to be wondered at, when we take into consideration the number of companies engaged and the amount of insurable property on this coast, which is only about \$75,000,000. This amount, it is asserted, is already covered by the various companies, and that the business of any one could only be extended at the expense of the others.

San Francisco Gas stock sold early in the week at 65, Spring Valley at 60½, and California Steam Navigation Company at 66, and at the close at 61@60.

The French Savings and Loan Society disbursed a dividend of 1 ¢ cent. per month to its depositors out of their net earnings during the six months ending December 31, 1866.

We refer our readers to the following dividends disbursed by the several corporations located in San Francisco since the first instant:

MINING COMPANIES.	Market Value of Shares.	Dividends.
Crown Point.....	\$50,000	\$50,000
Empire Mill.....	216,000	12,000
Hale & Norcross.....	1,000,000	40,000
Imperial.....	600,000	32,000
Savage.....	1,560,000	80,000
Yellow Jacket.....	1,488,000	60,000
Total.....	\$5,704,000	\$284,000

BANKS, ETC.	Capital.	Pr Cent.	Dividends.
Bank of California.....	\$5,000,000	1	\$50,000
California Steam Nav. Co..	2,500,000	2	50,000
San Francisco Gas Co.....	6,000,000	3	30,000
Spring Valley Water Co.....	6,000,000	3	30,000
* State Telegraph Co.....	2,500,000	2	50,000
* Fireman's Fund Ins. Co....	500,000	4½	22,500
* Pacific Insurance Co.....	750,000	6	45,000
* San Francisco Ins. Co.....	300,000	4½	13,500
* California Ins. Co.....	200,000	6	12,000
* Union Insurance Co.....	750,000	6	45,000
* Occidental Insurance Co....	300,000	4½	13,500
* National Insurance Co.....	1,000,000	3	30,000
Total.....	\$23,800,000	...	\$391,500

\* Quarterly—others monthly.

If we add to the above amounts the semi-annual disbursements in dividends to depositors by the Savings Institutions of this city, made during the present month, which we may safely estimate at \$400,000, we obtain a total distribution in dividends of \$1,075,500 for the current month.

## MINING SHARE REVIEW.

The Mining Share market has been characterized by a marked degree of activity during the past week, with, however, little or no improvement in prices of most stocks. So far as we can learn, leading claims in Nevada continue to be regarded with favor, and no abatement of their present yield is anticipated for some time. We note with pleasure that the initial step has been taken by the Empire, Hale & Norcross, and Gould & Curry companies to aid in the prosecution of the work upon the Sutro Tunnel. The first named company subscribed \$15,000, and the last two \$100,000 each.

HALE & NORCROSS—is still held in firm hands, and no sales transpired during the past week. On the 10th instant \$2,800 per foot was bid. The mine of this company continues in a favorable condition, and the returns at present are even better than formerly, the average yield of ore per ton being over \$60 from the first to the 12th instant inclusive, since which time 855 tons have been delivered to the mills. Owing to the moisture of the rock when the assays were made, 65 per cent. of which is obtained from the mills, a reduction had to be made

to said mills for account of December, the actual receipts of bullion having been \$131,135.41.

SAVAGE—exhibited considerable activity during the week under review, opening at \$1,955, advancing to \$1,975, seller 30, receding to \$1,890, rallying to \$1,950, then selling at \$1,960. During the week ending January 12th, 1,016 tons of ore were extracted, valued at \$35,923—more than \$35 per ton. The improved condition of the roads recently has enabled this company to ship an average of 300 tons per day to the mills from their reserves on hand at the mine. The north winze, from the 7th station, is said to be in good ore at a depth of 45 feet. The south winze, same station, at a depth of 75 feet, is leaving the ore to the west. A new winze, near the extremity of the south line, 7th level, is now under way, having attained a depth of twelve feet—showing good ore at that point.

CROWN POINT—has been well maintained, advancing from \$1,400 to \$1,440, then selling at \$1,325—ex-dividend of \$100 per foot paid 15th instant, and closing at \$1,275. For the week closing with the 11th instant, 980 tons of ore were hoisted to the surface, of which amount 722 tons were sent to outside mills. We learn of no material change in this mine recently. The average daily product of ore this week has been about 130 tons. The total yield of bullion the present month it is thought will be about \$150,000.

YELLOW JACKET—has been in rather less favor, receding from \$1,350 to \$1,190—ex-dividend of \$50 per foot, advancing to \$1,220, and then selling at \$1,200, and closing yesterday at \$1,225. The receipts of this company from June 30th last to January 1, 1867, amounted to \$1,596,927.56, being the product of 50,844 tons of ore, averaging \$31.40 per ton; receipts from other sources were \$37,023.33, which, together with the balance brought forward from June 30th, 1866, makes an aggregate of \$1,776,866. During that period \$390,000 were disbursed to stockholders in dividends, and \$1,287,105 were expended for labor, supplies, crushing ores, and various improvements, leaving a net balance on hand January 1, 1867, of \$99,760.58.

GOULD & CURRY—met with trifling sales at \$635@620, receded to \$592, and at the close sold at \$565. The annual meeting of this company is usually held in the beginning of December, but for lack of a quorum to receive a statement of their operations for the past fiscal year, no meeting was held until January 15th, when the following facts were elicited. The total receipts amounted to \$1,720,299.72. The principal disbursements were as follows: Mine, \$502,000; company's mill, \$562,000; outside mills, \$253,600; dividends, \$253,865. Mr. A. Bull, who has discharged the duties of the Presidency with great fidelity and efficiency for some time past, was re-elected by the new Board of Trustees to serve another year.

IMPERIAL—is in better request, selling early in the week at \$148@150, then at \$143—ex-dividend of \$8 per share, rising to \$155, and at the close \$155 is asked. Recent advices from this mine are favorable. In the west drift, on the 230-foot level of the Alta mine, a fine body of ore has been disclosed. In stopping a distance of 20 feet it has widened out materially, with every present indication of an improvement in width toward the west wall of the ledge.

CHOLLAR-POTOSI—has been in less favor, steadily dropping from \$257.50 to \$229, selling yesterday at 222. In drifting north from the first station, new shaft, indications seem to favor the existence of a considerable body of ore. The drift has extended 35 feet thus far, with 150 feet yet to run before reaching the north line. Assays from this deposit of ore are said to average from \$40 to \$75 per ton. During the past week 780 tons were sent to custom mills.

OPHIR—has met with rather more inquiry this week at enhanced figures, rising from \$155 to \$168, and closing at 165. The east drift from the ninth station is now in 400 feet, without any material change. The north stop is 45 feet in height, and is said to show promising looking quartz. The tenth station drift is under way.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$1,012,332.25.

## NEW PATENTS AND INVENTIONS.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

AN IMPROVED TRAY FOR GAS PURIFYING. Gas purification is one of the most important operations in the process of manufacturing illuminating gas. Hydrated or slacked lime is generally employed for this purpose, which is spread in thin layers of two or three inches upon wooden sieves or trays placed in the purifiers, in tiers one above another, with an intervening space. These trays are formed of lattice work or slats, leaving interstices or spaces through which the gas can easily pass and permeate the loosely laid lime, whereby the sulphureted hydrogen, ammoniacal gas and other noxious vapors are absorbed, and the gas is rendered less offensive in its odor, and much improved in its illuminating qualities. Iron in various forms has been employed for trays, but the gas soon corrodes and destroys them, and while the first cost is considerable, the frequent replacement necessary makes them too expensive for general use. Wood is ordinarily used, but the integrity or strength of the joinings of the slats and other parts is soon weakened by the action of the gas, and requires frequent renewal.

Mr. J. L. Cheesman, 147 Avenue C, New York city, as assignee of the patentee, has introduced an improved tray which obviates the above difficulties, by being cut out of solid wood, whereby all necessity for joints are removed. These trays consist of an arrangement of slats, cut bevel form, by machinery, so that on the upper side in which the lime is spread a very thin opening is left, through which the lime will not fall, while the under side presents a much wider opening, for the ascent of the gas. By this arrangement the gas is more readily brought into contact with the lime, than it can be when perforated sheets of iron are employed. The thoroughness with which gas is purified and rendered free from moisture, is very important as a sanitary measure, to say nothing of the improvement of its illuminating properties.

A NEEDLE CANNON.—HEIT VON DREYSE of Prussia, has invented a needle cannon as a companion for his needle gun. It is composed of two pieces fixed in one carriage; between them the ammunition chest is placed, and behind are seated the cannoners. The rear portion of each cannon opens to receive the cartridge, and the explosion is created by the bombardier leaning on a fork connected with an elastic tompon, which works alternately, firing one cannon now and then next, and so on. The cartridges drop into either piece by a mechanical arrangement. There is no recoil. The guns are invented for field practice, and some of them, a six-pounder notably, have made accurate and destructive shooting at a range of 2,000 paces.

## PATENTS RECENTLY ISSUED.

WAGON WHEEL.—Benjamin M. Esterle, San Francisco, Cal.: I claim as my invention and improvement in carriage wheels the use of a plate, so constructed that it may be used on the inside of the front wheels of a wagon and pass or slip over the lock or friction plate fastened to the carriage, for the wheels to rub against in turning the wagon.

COLLAGE CABINET.—William W. Levering, San Francisco, Cal.: I claim a cabinet constructed as described, and having a door serving for a black-board, and held up by bars, substantially as described.

REVERBERATING FURNACE.—J. M. White-side, San Francisco, Cal.: I claim, 1st, The arrangement of a revolving stirrer in combination with the oven, constructed and operating substantially as and for the purpose described. 2d, A protecting cap, in combination with a shaft, which gives motion to the stirrer, substantially as and for the purposes set forth. 3d, The arrangement of a supply-tank and stop-cock, which is operated automatically from the driving-shaft, in combination with the generator, tube or tubes, and the oven, constructed and operating substantially as and for the purpose described.

An extraordinary story is going the rounds, in reference to a young French girl, who is said to possess a certain singular attraction for objects of wood, such as chairs, tables, etc., which move towards her as she approaches.

Most of the oil wells in Southern Kentucky have been abandoned as failures.

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers. Jan. 1, 1867.

BEAVER & Co., of North Bloomfield, says the Nevada Gazette, are going to use a Brady & McAllister Locomotive Head Light in their hydraulic diggings, in place of the pitch pine fires commonly used. It is thought that it will give a better light, and be, moreover, cheaper.

AMHERST COLLEGE is soon to have the largest meteoric possessed by any cabinet in America. J. Alden Smith of Denver City, Colorado, has presented a mass of meteoric iron, weighing 536 pounds, to that institution.

DURING the late storm, the telegraph operator at Timbuctoo, Yuba county, received an electric shock, while at his instrument, which for a time paralyzed his right arm.

PARIS EXPOSITION.—The model of an oil well, with derrick, tanks, etc., will be shown at the Paris Exposition.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACARTHUR, M. D., Attending Physician; W. G. W. HARFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-1f

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 313 Montgomery street, San Francisco. nol

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shells, and Wax Flowers, besides Feathers, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 21v13-gr

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 21v13-9p

## To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-tic

## SALES OF THE WEEK

BY THE S. F. STOCK &amp; EXCHANGE BOARD

Monday, January 14.

AFTERNOON SESSION.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of January 5th: Although we have not learned the result of the recent working of Morning Star ore, at the Washington mill, but learn that a party who made a bet that it would go over the sum of \$125 per ton, have won. The mill is now pounding away on ore from the George Washington mine at Silver Mountain. This ore needs roasting, too, but not near so long as that from the Star. It is said the company can now get out sufficient to keep their mill running, and probably the concentrators on the Star will erect works nearer by for the reduction of their ores.

One day this week the workmen in the Tarshish tunnel cut a spur of very fine looking quartz, running in the right direction to be a feeder from some ledge ahead.

A blast was put in yesterday at the Mowyer, disclosing some very fine ore.

The Leviathan is proving itself a whale, indeed, among mines. Some miners who visited it yesterday, report that a drift to the left from where the black ore was found shows the vein to be raising and enlarging, and that the small veins of \$2,000 ore are becoming more numerous.

The *Chronicle* of January 5th, says: The Morning Star ore worked at the Washington mill, was the yellow, second class ore; and adds: "Unless a 'freeze-out game' is inaugurated to curse our country, there is no reason why a constant stream of billion should not flow from Alpine county after spring opens."

## Anador County.

The *Ledger* of Jan. 12th says: Frank McBride and three Italians, whose names we do not know, struck a rich quartz lode the other day near Pine Grove. The lode is good sized and very rich in free gold.

## Calaveras County.

From the San Andreas *Register* of Jan. 12th: We saw a nugget taken from Messrs. Marshall & Showalter's claim, a day or two since, on Donglass' Hill, of pure gold, weighing a small fraction less than ten ounces. These gentlemen inform us that lumps of from half an ounce to two ounces are quite common. They are down 134 feet, on what evidently has been an old river bottom, and are drifting upon the ledge. About two feet on the bedrock is "pay dirt." They inform us that Messrs. Gilchrist & Co. their next door neighbors, are doing first fate.

From the Copperopolis *Courier* of Jan. 5th: The Angels Quartz Mining Company completed their new 30-stamp mill last Monday, and it is now running in full blast. This company will employ in the future from 80 to 100 men. Attached to the mill is a patent crusher, capable of preparing for the stamps 100 tons per day. Boven & Co. have recently added new machinery for saving gold, to their mill, and are doing a profitable business. The vein is large and well defined. Stickles & Co., of the Union Company, are now doing better than ever before. They are also sinking the principal shaft as fast as possible, and find a decided improvement of the vein as it is followed downward.

At Carson Hill, Davis & Co. are preparing to put up a 20-stamp mill, which will be completed early in the spring. Southwell & Co. are also making preparations to put up a 20-stamp mill, and intend to complete the same at the earliest practicable moment. The above mentioned mines are all on the Mother Lode of California.

## El Dorado County.

From the Placerville *Democrat* of January 12th: Four tons of top rock, considered the poorest, from the Gillenwater ledge at Poverty Point, were crushed this week, and yielded thirty-eight dollars. When we take into consideration that the mill at which it was crushed has not been in use for some time, that the plates were warped and the machinery imperfect and out of order, the yield is something to boast of.

A Brownsville correspondent, writing under date of the 9th instant, says: "The Georgia company, near this place, are sinking a shaft on the extension of the Independence, and at a depth of eighteen feet struck very rich ore. The ledge at this depth is about one foot in width. The Missouri company are opening their mine. Their ledge, for a distance of two thousand feet, varies in thickness from three to six feet, and prospects well. The Stillwagon company have started their mill, and are now running day and night. They have a good ledge, but a poor mill. The Independence company are running a tunnel to strike their ledge seventy feet below their present works."

A Goorietown correspondent of the same writes that the tunnel on the Bohannon ledge is now in seventy feet. The Taylor ledge, about one mile south, was purchased some three months since by Mr. Green, of San Francisco, who has been at work erecting buildings and machinery to work the ledge, and have now got things in good working order. There is an incline started on the ledge five by ten feet in the clear, well timbered, which is now down thirty feet. The ledge is about eighteen inches wide.

The Collins company, about a mile east of the above, are prosecuting the work on their tunnel and will soon be into the ledge. The Alpine company are not working at present, but will resume in a short time. Surface mining is being prosecuted with considerable vigor, and more extensive than for years before.

From the *Courier* of January 12th: Work on the old Poverty Point mine is being prosecuted to some extent, although the mill is not running. The ledge is about nine feet wide, and the rock assays \$300 per ton; yet it cannot be profitably worked without proper apparatus for saving the gold. Mr. White has a 10-stamp mill upon it.

Stewart & Hall have erected an 8-stamp mill on their cement claim on Texas Hill, and commenced crushing on Wednesday last. They have a tunnel in 600 feet, and in many places along the tunnel have breasted out or run side drifts for a distance of thirty feet or more on either side. At Smith's Flat, two miles above this city, cement mills have been running for a number of years, with very flattering success, and there can be hardly a doubt that the mines on Texas Hill will pay equally as well.

Mr. Shepherd commenced work on his claim on the 20th of November last, and the third day took out gold to the amount of over \$1,000, since which time he has averaged fifty dollars a day for every day's work done in the shaft. He is now working a cut in a ravine, a short distance from the original discovery where the vein is four or five feet wide, composed of a substance so soft that it can be easily mashed like clay between the thumb and finger, and pays well for sluicing. This is near the surface. As it is followed down it gradually grows harder, and changes into solid quartz, filled with rich sulphurets.

Since the storm has abated, renewed activity is seen throughout this county. Quartz, cement and gravel claims are being worked in all directions. The discovery last week at Dugan's, near Latrobe, is only second to the famous Woodside in richness.

The Decomposed lode is being worked for miles. From the South Fork of the American to Weber Creek, shafts are being sunk on nearly every claim. White & Co. are getting good prospects. Shepherd & Co's claim is paying big. The Nevada company are running a tunnel. Chubb, Napier & Co. took out not four ounces, as we stated last week, but nearly forty ounces. Hall, Leon & Wright Bros. are getting out fine prospects. Collins & Co. are now going down with the fourth shaft. Blair & Co. are opening the old Wynkoop mine. Bee & Murgotten are going down one hundred feet before they rest. Williams & Co. are going down with a shaft near the old Jest House.

Letter from El Dorado: The Union company at Anrum City have lately bought the old Central mine, and are taking out very rich rock. The New York El Dorado company are opening out their mine. They have a good mill. The Montezuma, at Nashville, is to have a mill. Goldy & Buffington are taking rock from the Pocahontas which will pay twenty to thirty dollars per ton. The vein is five feet wide.

A telegram from Placerville, dated January 15th, has the following: The Union Quartz Mining company claim, located near Mnd Springs, has been sold to a Brooklyn (Kings county, New York) company. The deed was filed to-day for record, and calls for \$1,200,000, and has \$1,200 in revenue stamps on it.

A claim was sold to-day on the New Discovery Decomposed Quartz lode for a large sum, not made public, to parties from Gold Hill, Nevada.

## Nevada County.

From the *Gazette* of January 11th: Jacobs & Sargent are now mining quite extensively at Quaker Hill and vicinity. They employ forty men, and keep their pipes running night and day. The Green Mountain mill is crushing cement, and is kept in constant operation.

A tremendous slide occurred at Hunt's Hill on Wednesday. The Gougeye mill, which was erected in a deep hydraulic cut, and close to the high bank, was crushed in and almost completely destroyed. The mill belonged to Goodspeed & Co., and has lately been netting the owners some \$700 or \$800 a week. The mill of the Eastern com-

pany, which is situated a little below, had not been injured up to yesterday morning; but the slide is continuous and gradually approaching the mill, and it was feared that it also would be destroyed.

Same of 15th: We learn that the Oro Fino company, on Bush Creek, have struck remarkably rich rock in their Diamond ledge—one of the series which they are working. The strike was made about thirty feet below the surface, where the ledge is twenty inches in width, free gold being visible through all the main rock. They will commence crushing the rich rock in a few days.

From the *Transcript* of January 10th: The Leocompton mine, owned by J. J. Ott, is located on Deer Creek, a short distance above the Oriental mill. The incline is down about one hundred and ten feet, and the ledge is about six inches wide. The ore now is a solid mass of sulphurets of great richness. Recent assays have been made by fire and amalgamating, and by the first the rock paid at the rate of \$1,500 to the ton.

Same of 12th: We visited San Juan last week. The mines have improved during the year. On San Juan Hill some four or five companies are at work. The New England company has just completed its first run and took out \$3,500. The American company can count to a certainty on taking out from nine to ten thousand dollars after each run of from twelve to thirteen days. The last run yielded them \$10,000. The San Joaquin company, after their last run, cleaned up \$22,000. The gravel claims on the ridge have not yet been worked out by any means. The Manzanita ridge has been opened at both ends and is known to be very rich. The Yuba Tunnel company have run a tunnel from the Main Yuba river below the junction, and will soon be ready to commence washing. At Sweetland, Buckeye Hill, Birchville and French Corral, the mines that are being worked are yielding fair profits. At French Corral a number of the larger companies are at work cleaning up.

Mining on the ridge above San Juan is also lively. At Cherokee little is being done, but the English company at Badger Hill is washing, and during the past year these claims have yielded very large returns. At Bloomfield the French company have struck hard ground in their tunnel; but they have run up a side cut into their lower claims, and are washing with excellent prospects. The most encouraging reports come from every part of the ridge, and it is thought that this will be the most prosperous season for many years.

From same of 13th: A gentleman who traveled through Little York Township last week, informs us that fully twice as much ground is being worked as has been washed for the past two years. Many of the old claims which have lain idle for several years have been fitted up and are being worked.

From the Grass Valley *National* of July 12th: It is proposed to move the office of the Last Chance company to Sacramento. A meeting of the stockholders is called for the 9th of February.

Same of 14th: We learn that the long idle claim known as the Bowery, between the North Star and the New York Hill company's works, is indicating well. Hoisting works and pumps have been erected. The ledge is from ten to fourteen inches thick, and the proprietors are confident of success. The ledge shows gold plainly. In connection with this, we may state that the North Star company are erecting a "pnpet-head" on their new shaft now being sunk on their portion of the ground known as the Laramie claim. This is preparatory to constructing additional works.

A large nugget was picked up on Saturday near the Union Hill company's works, which contains about twenty-one ounces of gold, with just rock enough to hold it together.

EXCELSIOR.—The Meadow Lake *Sun* of January 12th says: At the works of the California company they have over their shaft a building, with a heavy frame, and have thus far experienced no delay or damage from the late severe storms. Their work has continued night and day; they are now down about seventy feet, and indications are already abundant that they are rapidly nearing their main ledge.

The Golden Eagle company intend starting their new mill on the 16th, and judging from the character of the rock, we may expect to hear good returns therefrom.

## Placer County.

From the Dutch Flat *Enquirer* of Jan. 9th: A friend who visited Gold Run on Monday, gives us these items: Our enterprising neighbors at this prosperous mining town are undermining and washing away its auriferous banks with great energy and activity. I counted more than twenty hydraulic companies, all but one or two of which are in successful operation. Nearly all these companies use 300 inches of water

—rarely ever less than 250. One, Messrs. Harkness & Co. use 600 inches. The depths of the banks range from fifty to one hundred and fifty feet, the depth increasing as they advance towards the line of the divide. The dirt at the present depth, is sufficiently soft to yield to the hydraulic power applied and dissolve readily.

An Iowa Hill correspondent of same says, January 10th: The Morning Star company's last clean-up amounted to \$4,800, the result of twenty days crushing; the expenses during this time amounting to \$1,200, leaving the handsome dividend of \$3,600. This claim greatly resembles the once famous North Star claim. The Lebanon company will start a new 10-stamp mill in about two weeks. The Oriental mill, at Wisconsin Hill, has been idle for the past three months.

The same paper speaks of the Hawkins' claim at Gold Run, as having the most thorough and complete arrangements for saving the gold. An alternating succession of flumes and ground sluices, with a fall of 206 feet, secure this end.

The *Stars and Stripes* of Jan. 9th, says the new sulphuret saving machine of Johnson & Smith, which was erected at Mallett's mill, works beautifully.

## Plumas County.

From the Quincy *Union* of Jan. 5th: The Monitor Company are at work in their tunnel, and will keep "pegging" away until they strike the back channel. . . . None of the quartz mills near Greenville are running at the present time; they will all start up again in a few weeks. . . . Bachelor & Co., have again commenced hauling quartz from their ledge, in Cherokee, to Bidwell's mill, in Dixie Cañon, which is crushing it. The rock is paying well. . . . Several of the mining companies at Saw Pit, have been at work washing pay dirt, during the past three weeks. The New York Company took out 300 ounces, the result of one week's washing.

"Observer" writes to same from Crescent Mills: Everything is in a flourishing condition in this section. A new quartz lode is in process of opening. Plumas mine is paying well. The storm did but little damage in this locality. The Crescent Company will soon have the water out of their tunnels.

From the *National* of Jan. 5th: The Last Chance Company are driving away energetically at their deep bank of gravel. The Upper Crust Company, at Independence Bar, are getting flattering prospects—from three dollars to half an ounce to the pan.

Boston & Loring, at Oregon Bar, are taking out from \$500 to \$600 per week. The Chinese Companies are probably doing well.

## Shasta County.

From the *Courier* of Jan. 5th: An assay made last week, of rock from the Pacific claim, South Fork, showed \$228 in gold, and \$172.79 in silver, to the ton. The rock was from a depth of seventy-five feet. The lode is thirteen inches in width, with indications of growing wider as the shaft descends.

Since the freshet, considerable gold has been picked up in the gulches in this vicinity. One enterprising prospector realized \$18 for one day's labor, finding one piece worth \$7.50.

At the last run of the Potosi mill fifteen tons of rock were reduced, which yielded \$1,111.28.

## Sierra County.

The mining property of Cole & Stevens, at Brandy City, has been purchased by Philip Van Rensselaer, of the State of New York, for \$100,000. The property consists of some of the best gravel claims in the county, which will be developed as fast as men and money can do it.

The refusal of the Sierra Buttes mine, twelve miles east from Downieville, has lately been given at \$575,000 to San Francisco parties, who, it is understood, will offer it for sale in New York.

## Siskiyou County.

From the Yreka *Union* of Dec. 22d: The late rains have so raised Scott river that the miners at Scott Bar, have been compelled to stop all work in the claims for the season.

. . . McAdams creek is rising very fast from the recent rain. Mining, however, has not ceased.

Same of 29th: Extensive preparations have been made for working the Mexican lead on Humbug. Everything is in readiness, and immediately after New Year's they will commence operations. . . . It is reported that the Chinese miners on Greenhorn have met with better success this year than usual. Several of them have made their fortune, and are about to leave for their homes in China.

## Yuba County.

From the North Californian of January 12th: The Brown's Valley mines give greater promise than ever. The Pennsylvania is now in the full tide of prosperity. It has completed the erection of its new machinery,

which is of the largest and most improved pattern, at an expense of \$25,000. The shaft is 480 feet in depth. They have an eight foot ledge of fine rock. Since the first of January they have been taking from the plates about fifty ounces of amalgam every twenty-four hours. The batteries are not cleaned up until the end of the month. The old machinery has been removed to incline No. 2, in which, at a depth of 190 feet, they have a ledge of good pay rock two feet in width.

The Jefferson company are working upon a fine ledge of rich rock, and a drift running north from the incline at a depth of 490 feet. The machinery is of the best. The engine alone cost \$16,000. The Pacific and Daniel Webster are being developed with great energy.

The Sweet Vengeance is inactive—a game of freeze-out, we are told, being played by its owners.

At Park's Bar, three miles distant, the ravine claim of Messrs. Wessels & Co., McQueen's Rocky Hill claim and the Turfrey claim, are all being successfully worked.

There are within a distance of three miles about 250 Chinamen mining profitably, distributed about as follows: At Park's Bar, 75; Long Bar, 75; Poverty Bar, 20; Prairie Diggings, 80.

At Seabby Hill, about a mile distant, the Bare Ripe and two or three other companies are developing promising ledges of quartz.

#### BRITISH COLUMBIA.

We have the following telegraphic news from New Westminster, January 9th: News from Cariboo represents mining matters in a very flourishing condition. The Heron claim on Grouse Creek yields dividends ranging from \$200 to \$500 a week to the share. The Old Welsh washed up in one day 250 ounces; the Australian is panning out fifty ounces a day steadily. There will probably be few, if any, claims lying over this winter, as the weather thus far indicates an open season.

#### COLORADO.

From the *Transcript* of Dec. 19th: An incorporated tunnel company has just been formed to operate extensively in the mines of James Creek district, with Gen. Bela M. Hughes at its head, which will at once commence the work of running extensive tunnels, and other operations for mining largely. Over the point where they are starting their tunnels is a wonderful "blow-out" of ore, containing gold, silver, copper and galena, and by running tunnels into the mountains they expect to strike a large number of lodes at a great depth. Coal, wood and water are all perfectly accessible to their works.

From the *Denver News* of Dec. 26th: The great average richness of the ores of Red Mountain district, has been demonstrated by many assays. The Hattie Jane lode, owned by William H. Morse, and others, carries free gold to such an extent, that an ordinary sample of its ores yielded by the common stamp mill process, \$160 to the ton. The Lane lode, by assay, returns \$600 in gold and silver, per ton. Forty-seven assays from as many different lodes in this district, made by Messrs. Behr & Keith, gave an average return of \$120 per ton. Many of the lodes are very rich in copper; among the most remarkable of these, there is one that shows seventy-seven per cent. of its material to be copper, and yet gives by assay the rich return of \$420 in gold, and \$20 in silver.

Letter to same from Columbia City, Ward district, has the following: Times are rather dull at present, but bid fair for the better in less than a month. The burning of the Ni-Wott Company's mill caused a drawback for a few days. Big things are expected as soon as the new mill is running again. The company will commence rebuilding in the course of two weeks, the machinery suffered no serious injury from the fire. The first lodes of the district are the Columbia, Philadelphia, Comet, Tubbs, Manhattan, and a number of others not yet fully defined. Several mills will be erected as early in the spring as possible. I am of the opinion that this district will prove herself equal to any other in the mountains; it is young and has never received much attention or notice from practical miners. Work seems to be plenty, not many idlers to be seen. Board per week \$10; wages \$4 per day.

From the *Register*: The Kipp & Buel mill is running on Gunnell ore, and also on ore from the Kansas lode. The work on the Leavitt lode is progressing rapidly, the shaft having attained the depth of 115 feet. Mr. Keith has purchased a quantity of Gunnell ore, and is running about nine cords per week with fine results. Mr. Dubois is working on Fiske ore, and is running about nine cords per week. His mill is now in fine working condition. A new stamp mill is being erected in Black Hawk, just above Lyon's works. It will contain eighteen

stamps at present, being intended for twenty-four stamps. It is intended to run on Peregrine ore.

The Gunnell Company have just taken 133 ounces of amalgam from one Bertola pan after a run of forty-eight hours. They are now running sixty-seven, having engaged the twelve stamps of Kipp & Buel, of which they now have only six. Their own mill on the Nevada road will shortly be in operation. Their last semi-monthly report showed a yield of 389 ounces from 47½ cords of ore. The report previous showed a yield of 408 ounces from 45½ cords. The profits of the company are now about \$1,500 per week.

Mr. Van Tassel has lately run one and a half cords of Fairfield ore in the Chase Company's mill, from which he obtained fifteen ounces of gold, valued in currency at \$330.

#### IDAHO.

From the *Owyhee Avalanche* of December 29th: The Shoenbar mill made a start on Monday of this week. Every thing looked business-like—teams were unloading more rock, and all things were promising. Quite a number of Owyhee people were present at the starting.

From the *World* of December 15th: A letter from Pioneer City has the following: The water has been turned out of the ditches, and our miners have gone into winter quarters, satisfied with the past season's work, and hopeful for the next. But little work will be done this winter except in quartz and deep diggings, and getting out timbers for tunnels, etc.

Wilson & Co's ditch will be extended a distance of three miles early in the spring. It will cover a large scope of country not worked heretofore. The price of water will be reduced twenty per cent.

#### MONTANA.

From the *Post* of December 22d: The last clean-up of Turnley's mill was about \$3,000, from Whitlatch Union ore. . . . Whitlatch, out of eleven ounces of rock taken from his lode, took out nine dollars. . . . There has been a new gulch struck somewhere in the vicinity of El Dorado Bar, on the Missouri. Fifteen dollars, we hear, is about the average to the pan of dirt. No particulars until after the stampede is over.

Helena items: The most favorable reports continue to come from the Salmon River mines. There are a large number of miners who have built cabins for the winter, and a general stampede may be expected next year. A reliable gentleman states that he worked out on the 11th instant \$20.81 in three hours, and on the 12th instant, \$19 in the same time.

Mr. Laird is bringing a ditch from Oro Fino Gulch, which will be finished and in running order in about a week. The ditch is capable of carrying two hundred and fifty inches of water, and should the weather continue as fine as it is at present, it will make things lively in Dry Gulch. There will be 1,700 feet of fluming to be done.

Letter from Deer Lodge to same says: From Mr. Patrick Corbett we learn that the quartz ledges of Flint Creek district show unusually well, and that the Codova, Camanche, and about one dozen others are being thoroughly developed. From Professor Dedesheimer of your city, who has visited this district, we would infer that the surface indications are equal, if not superior to those of the far-famed Rattlesnake region. Mr. C. also informs us that the gold ledges of upper Flint are supposed to be of a superior quality, and that the prospects for "Henderson's" being a good camp the ensuing season are very flattering.

#### NEVADA.

##### Esmeralda.

From the *American Union* of January 6th: The miners are still sinking on the Juniata mine, and, as we are informed, with very good prospects of opening a permanent and paying lode.

In Pahdet district we learn that the mines are being worked as well as could be expected, considering the amount of snow they have had to contend with. Governor Blasdel is interested in the district, and promises to assist them in erecting a mill in the spring. Several tons of the ore have been worked in Aurora, and paid handsomely, and the company feel confident that with reduction works at the mines they will prove valuable.

##### Humboldt.

From the *Register* of January 5th: The General Grant ledge was recently bought by the Pioneer & Iuskip M. & M. Co., of New York. Mr. Fall has just worked two tons of rock from the ledge, procuring thirteen pounds of crude bullion which he is confident is worth about eight dollars the pound.

From the *Salt Lake Velleite* of January 5th: We learn from the Messrs. Day and others, just arrived from Palranagat, that Mr. Raymond, the agent of the Pioneer company, which is an organization composed

of New York capitalists, who have recently invested a great deal of money in this region, has made large investments. The last amounts to \$150,000. The mill at Hicko Springs is working the ore of the Illinois lode with great success.

##### Reese River.

From the *Reveille* of December 31st: The Keystone mill closed on Saturday for repairs, which will probably occupy a fortnight. An efficient crusher will be added, and the mill is expected to crush at least three tons more in a day than heretofore.

Eleven tons of ore from the Woods and Buel location on the High Bridge, in the Silver Bend district, just reduced at the Keystone mill, yielded \$2,289, averaging about \$211 per ton. Four tons from the Eureka district, sixty miles east of Austin, reduced at the same mill, yielded about \$600.

We are informed by persons just arrived from Hot Creek that the 10-stamp mill of the Combination company had let its stamps fall on Friday morning, and is now fairly in motion reducing the ore of the district.

From same of January 3d: Mr. Charles Durning arrived in town yesterday afternoon, from Cortez, with 1,600 pounds of bullion from the mill of the Mount Tenabo company. We learn that this amount was produced in twenty-eight days, of twelve hours each. The mill is ill-arranged and poorly furnished. The ore is packed a distance of eight miles from the mine to the mill, at a cost of ten dollars per ton. We understand that the entire expense of mining and milling the ore rates from thirty-five to forty dollars per ton. Work has been suspended, but will be resumed within sixty days.

From the same of January 4th: Thirty-five hundred ounces of bullion were yesterday brought into town from the mill of the Twin River company.

The "Nevada Giant," in Lander county, seventy miles northeast of Austin, is, in our belief, one of the most wonderful silver veins in the world. It is imbedded in Mt. Tenabo, crops out 3,000 feet above its base, and with a width of 400 feet, stretches itself out in plain sight to the length of 18,650 feet. On this giant vein twenty locations have been made, with the following names and dimensions: Commencing at its greatest point of altitude is the Chieftain, Genesee company, 1,400 feet; Murphy company, 800; Gill company, 800; Taylor & Passmore, 800; DeWitt & Co., 450; St. Louis company, 2,000; Meacham & Bros., 400; Niagara company, 400; Savage company, 400; Nebraska company, 1,200; Cortez Giant, Mt. Tenabo company, 4,000; Elmore company, 200; Russell company, 600; Continental company, 1,000; Argentine company, 1,000; Empire company, 800; Conn & Bros., 400; Traverse company, 400; and the Anna Burr company, 2,000 feet. The vein has been opened at several points along its course, in every case disclosing good mineral. The Gill, Taylor and Passmore, and St. Louis locations, have been worked, the two latter considerably; the Cortez Giant is the most fully developed, and has yielded a large amount of bullion this season. Some work has also been done on the Continental. This huge vein, now so little known, will in time be developed, and will be regarded as among the wonders.

From same of Jan. 5th: Twelve hundred pounds of bullion, valued at \$18,000, was shipped to-day through Wells, Fargo & Co. The larger portion of the bullion was from the Mount Tenabo company, in the Cortez district, and the remainder from the Twin River company.

The mineral tested in the mill at Hot Creek, at its first working, was from the Keystone ledge. Although the ore was of good quality, the result was not satisfactory. Perhaps furnaces will afford the remedy.

Same of 7th: A letter from Reveille district has these items: The excavation made on the Fisherman ledge shows a good body of fine chlorite ore, similar to that carried to Austin and worked at the Keystone mill. The owners of the Etna ledge have run a cut, which develops a good foot-wall, and a large body of excellent ore. The Crescent is looking handsomely, although they have not yet gone across their ledge, but at a depth of twelve feet the character of the mineral had greatly improved. A great many discoveries have been made lately, and everybody seems pleased with the prospect. T. F. Gould, of Hot Creek, has purchased two mines here, called the Silver Star and Circinnatus, and has put eight men to work on them. Messrs. Brobant and Kellogg have made a number of good locations south of the Fisherman ledge, and they are about to erect an arrastra immediately, for the purpose of working their ores. Last week two large springs were discovered within two miles of the locations, which will give ample water for a 10-stamp mill. The

weather is warm and pleasant, and there is no snow in the district.

Same of 8th: Prospectors are fairly rushing to Reveille district. An extension has been taken on the August—one of the original locations—and named the Etna, which is declared to be from thirty to forty feet thick, and exhibiting the finest quality of mineral. A 5-stamp mill is on its way to the district.

A Gardiner Crusher will be immediately added to the mill of the Consolidated company at Hot Creek. It will increase its capacity one-third.

The Metacom works will be closed for a time, for the purpose of adding more barrels. While in operation, the mill worked well. The ore from above the water level averaged sixty dollars per ton; below, eighty dollars.

During the month of December the mill of the Twin River company produced bullion of the value of \$46,700, against \$36,000 produced in the month of November.

"Saxton" writes the *Enterprise* from Belmont: This place affords greater facilities for mining and reducing ores, when the necessary machinery is erected, than any place I have seen in the State of Nevada. If the Comstock lead was situated on the foothills skirting Washoe Lake, on the east, it would not then be located in a more feasible place for obtaining wood and water, or for the erection of machinery, than the prominent leads in and around Belmont are. Water in almost every gulch, wood on every hill, easy of access, and large, valuable, and apparently inexhaustible veins traversing every hill-top, crossing ravines, and coursing every way hither and thither over this vast country, presents inducements to the practical miner rarely equaled, and never excelled.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Jan. 8th: The Kentuck Company are sinking their shaft one hundred feet deeper than it is at present. The Yellow Jacket and Crown Point Companies are also soon to commence sinking deeper. . . . A stream of water was struck in the long tunnel of the Cole Company yesterday. The first rush drove the workmen out. It indicates the immediate proximity of the ledge. . . . The Central mill, which has for a few weeks past been at a stand-still for repairs, started up again yesterday morning.

From same of 9th: The Yellow Jacket Mining Company, yesterday morning, declared a dividend of \$50 on each and every share of the capital stock of the company.

Fifty inches of water is still running from the Cole tunnel. Should it continue, it will be a source of revenue in itself. The prospects of the company are very flattering at the present time.

From same of 12th: The Ophir Company are drifting east from their shaft, in hopes to strike the rich lead now being worked by the Halo & Norcross and the Savage Companies. They have recently encountered an increased quantity of water in their shaft.

The Yellow Jacket Company have opened a fifth level in their old works, at the depth of 600 feet, where they have a good body of rich ore, which they will proceed to take out when the re-timbering of their old shaft is completed.

The Granite mill, which has lain idle for some time past, has been leased by Lem Colbath and others, and is to be thoroughly overhauled and repaired.

From same of 13th: During the past two or three days rumors have been very prevalent of the discovery of a very rich silver ledge in the mountains, about eight miles to the northeast of this city, and several parties have gone out to see about it. Some of the ore is said to assay very satisfactorily. The ledge is about four feet wide, but of the length or depth of it little is known as yet.

From the *Gold Hill News* of Jan. 10th: Yesterday quite a number of Virginians were out to see the new discovery recently made northeast of this place some eight miles. They brought in some of the ore with them, which looks well. Some of it shows free gold. The ledge is from one to three feet in width. Some of the parties who were out to see the mines and with whom we conversed, think well of them.

The Bullion, after drifting in almost every direction, have started a drift to the east, and like the Halo & Norcross, will be very liable to strike good ore, as the pay ore at a great depth, seems to lay well to the east.

The same gives a tabulated statement of the bullion product of the State for 1866. The total is \$16,171,381. The amount shipped from Virginia and Gold Hill, was about two millions in excess over that of 1865.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
SAN FRANCISCO, Jan 11th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

Mr. S. D. Whittaker, is our authorized Traveling Agent and solicitor from this date. Jan. 1, 1867.

## San Francisco:

Saturday Morning, Jan. 19, 1867.

## Notices to Correspondents.

S. L.—You have lost. Crown and half crown pieces are of much more ancient coinage in England, than the year 1668; as a proof of which, we must at present let the following illustration suffice: "A mint for the coinage of Welch silver was established previous to the reign of Charles I., at Aberystwith. The indenture was granted to Thomas Bushe for the coinage of half-crowns, shillings, sixpences, twopences and pennies, all of which were to be stamped with the ostrich feathers on both sides." The above franchise was granted in the year 1641, and was done for the purpose of encouraging the development of the rich Cardigan silver mines which had commenced working some time previously. It was from mines in the same vicinity that Sir Hugh Middleton obtained, about fifty years previously, the immense wealth which enabled him to construct the celebrated New River. As an appropriate and probably interesting pendant to the above we may add that the English silver penny of Edward III. was ordered to weigh thirty-two wheat grains from the middle of the ear; twenty of these pennies were to weigh an ounce, and twelve ounces a pound; eight pounds were to be equivalent in weight to a gallon of wine, eight such gallons to a bushel of wheat, and eight bushels a quarter. A very rude mode of fixing a standard of value, as the weight of a gallon of wine varies greatly, accordingly as the saccharine matter of the grape had been formed into alcohol, and again, as the latter might have become converted into vinegar.

"INCREDULOUS" may disabuse his mind of the impression that the asserted attempt which it is purposed to make shortly near this city, of practically proving the feasibility of navigating the air by means of steam, is a hoax. Whatever may be the result, we can assure our correspondent that the projectors and designers are serious. In the course of the present week, we have seen a party who had the day previous been to Shell Park on business connected with the contemplated attempt, and we are assured by him that advantage is being taken of the present favorable weather, in order to push matters forward as rapidly as possible, so that in a very short time the public will have the opportunity of judging of the feasibility of the scheme, equally with the projectors. We are not sufficiently well informed ourselves, on matters connected with the construction of the *Avitor* to form any opinion on the matter; all that we can state is that several persons whose practical knowledge is considerable, think that the trial will prove not to be a failure, but on the contrary quite as great a success as can reasonably be expected for a first attempt.

"J. W. C.," of Newcastle, Placer county. We have sent you an illustration of the "Chloride of Sodium Process," about which you inquire. We have also given a full description of the same on page 34 of the present issue, for the benefit of our readers generally.

"L. B. C." of Smartsville, writes us to describe the *modus operandi* of blasting by electricity. We will endeavor to do so next week.

ARTESIAN BORINGS FOR OIL in California have been almost entirely given up, and the plan of securing the seepage of the springs by means of tunnels adopted.

## California Academy of Natural Sciences.

This Association held its Thirteenth Annual Meeting on Monday evening of last week, on which occasion the attendance was the fullest ever witnessed since its organization. The principal business of the evening was the election of officers, the result of which was given in our issue of last week. Our present purpose is to call the attention of the public to the condition, the importance and the needs of this Institution.

During the chief portion of the existence of the Academy, and indeed up to the last year, it has struggled along with scarcely a score of members, very few or none of whom, have had the good fortune to be numbered among our wealthy, or even well-to-do citizens; yet these men have continued, year after year, to labor with untiring diligence, and to devote their money and their time to the promotion of science and the development of the natural history and resources of the Pacific Coast, until they have at length accumulated a vast amount of information of the highest importance to its scientific and industrial development, the chief part of which has been published from time to time, until three volumes of printed matter have now accumulated. The value of this information has been fully recognized by scientific men in the Atlantic States and Europe, who have eagerly, both in their individual capacity and as scientific bodies, sought for the publications of this Association, until its first volume is now entirely exhausted, and the second nearly so. The Society has collected a cabinet of several thousand minerals, nearly 4,000 conchological specimens, botanical specimens almost without number, and the most of them entirely new to the botanical student, together with some 1,500 specimens of paleontology, illustrative of the age and character of our geological formations. By a system of exchanges and donations, chiefly from members, they have also collected a scientific library of considerable extent and inestimable value, comprising some of the recent and most valuable scientific publications of the day. But very few of the books can be found in any other library on the Pacific Coast, and many of them could not be purchased at all, in the ordinary way of trade. All this has been accomplished by the unaided exertions of about a score of men, all told, who have devoted their time and money for this purpose, gratuitously, or for the mere love of science and of scientific progress.

Thus far the Association has labored along, almost unknown and unnoticed by our money-getting citizens. Having no popular demonstrations in its programme of operations, it has hitherto failed in attracting the public eye, meeting only the sympathies of a few plodding devotees of science in our midst, or such of that class as have, from time to time, visited our city. Hence, it is probably to-day better known in Europe than in California. But, thanks to the progress of human events, and the spirit of scientific inquiry which, within the past year or two, has been rapidly gaining ground in this gold-getting State, a better day is about to dawn upon this important and meritorious Institution. During the past year the membership has more than doubled, and is still constantly increasing. One year ago last October, the great earthquake so shook up the dingy, dilapidated old shell in which the Association was allowed to meet, rent free, for the reason that nobody else would meet in such a place, that even the California Academy, poor as it was in purse, did not dare to stay there any longer, and risk, within such rickety walls, the precious collections which it had brought together with so much care and pains-taking. So the Curators packed up the various valuables under their several charges, which, together with the library and fixtures, were stored away for safe keeping to await the "better time coming;" while the Associa-

tion, with a determination to "never say die," met for some months, on sufferance, in a private office on Montgomery street.

Soon after, prospects began to brighten a little, and the Academy ventured to hire a small room in the fourth story of one of our leading banking institutions.

Prospects still continued to brighten; new members were constantly coming in, until the little room was too small to hold the increasing numbers. It was finally resolved to secure a more eligible place of meeting, and one where the library and collections of the Association could be properly put up, and a reading-room attached. This desideratum has at last been accomplished and the Association met, for the first time, at their new quarters, 622 Clay street, on Monday evening, 7th instant. The two main rooms, which are thrown together by an arch in the center, and which are designed for the Cabinet and for meetings, are fifty by twenty feet, and the Reading and Library Room adjoining, twenty by twenty feet. The rooms are neatly fitted up and carpeted, and the collections will soon be put in order.

We have, in this city, many persons of scientific inclinations, who are not yet members of the Academy, but who might find in its rooms excellent facilities for special research; and who, in turn, might contribute much by their presence, their investigations, and the pecuniary aid derivable from their membership, to help along and render still more useful this excellent Institution; to all such, a general invitation is extended to come in and aid us by their presence and assistance. The benefit will be mutual. Associations of this kind are now ranked among the most important educational institutions of all civilized countries. Hence, they usually receive liberal aid from governments, and wealthy friends of science everywhere. The "Boston Society of Natural History" has received several hundred thousand dollars, in all, from the State, city, and private donations. A single private bequest, that of Dr. J. W. Walker, has added \$250,000 to the funds of that Association.

What the California Academy needs, at the present time, is a permanent building of its own, with suitable rooms for meetings, for lectures, a proper display of its collections, etc. With such accommodations it should, and doubtless would, be appointed custodian of the collections of the State Geological Survey, which, added to the rapidly increasing collection of the Academy itself, would soon comprise one of the most varied and valuable treasuries of the kind to be found in the world. The field of research on this coast is new and rich, presenting a most rare opportunity for procuring desirable exchanges, by which it will be gradually enriched with contributions from every part of the globe.

When such accommodations are secured, and a proper fund provided for their care and maintenance, courses of free lectures on scientific subjects, popularized to meet the wants of the multitude, will be established; the Cabinet, and other collections, with printed catalogues for private instruction, will be thrown open on stated days, and the transactions of the Society published more freely and more in full, with perhaps popularized editions for the purpose of increasing a still more general interest in scientific and useful knowledge—thus making the Academy, what it desires to become, a medium not only for the collection, but also for the diffusion of useful information, and the promotion of education generally. The advantages of such an institution, with its collections, to even the common schools of our city, which might be allowed to visit the rooms at stated intervals, accompanied with proper instructors, could scarcely be estimated in the increased educational interest it would thus infuse into the minds of our youth.

It rests with the public spirit of the peo-

ple of the city and State, and with our legislators, to say how much of all this shall be realized, and how much the "California Academy of Natural Sciences" shall be allowed to do for the honor and improvement of the State. Where are our rich men, who reckon their incomes by scores of thousands annually? Cannot some two or three such be found who would do a noble deed for education and science, and thereby link their names, for all coming time, with what may thus become one of the proudest, noblest and most useful Institutions of the land? Marble palaces will crumble into dust; granite walls and monuments will decay, and the names engraven thereon pass from the memory of man; but so long as the world stands, and literature flourishes, the names of Smithson, of Astor, of Stewart, of Peabody, and many others like them, will live in the grateful recollections of those who, from generation to generation, will be made the recipients of the blessings derivable from their well-timed and judicious application of those favors which fortune bestowed upon them in their life times. It does not need the munificence of a Peabody, or a Smithson, to do a work at this time, which, in a few years by natural aggregation, will increase with the growth of the community to magnificent proportions. A sum, at this time easily within the reach of three or four of our rich men, the parting with which they will never feel, will be sufficient to set in motion the machinery, which will go on, gathering power and influence with its progress, until all that is desirable will have been attained.

PARIS EXPOSITION.—The Committee of arrangements for properly representing California at the Paris Exposition, met on the 12th inst. Mr. Stowe, Chairman of the Finance Committee, reported that it was doubtful whether much money could be collected in the interior at this season, and that it would probably be possible to collect a sufficient sum in San Francisco to defray all expenses. He also stated that Professor Blake, fearing lest the impression might go abroad that he desired a contribution to be taken up to defray his personal expenses, had handed him a letter, which he would read. The letter was dated Jan. 10th, and reads as follows:

Messrs. J. W. Strong, J. Deeth, A. Weill, and I. N. Hoag, Paris Exhibition Finance Committee:

Gentlemen:—Permit me to withdraw my name from your application to the public for funds to pay the expenses of the representation at Paris. I have before stated my aversion to a subscription for my expenses as Commissioner.

It will be inconvenient for me to leave at the earliest date, and remain there until the end of the Exhibition. It is perhaps better, therefore, that I should pay my own expenses, and be free from any special obligations or restrictions. This will permit me to go and return at my own convenience and pleasure, and will not prevent my doing all in my power to serve the State and its interests while at the Exhibition and in Europe. Respectfully, W. P. BLAKE.

Mr. Weill moved that the letter be accepted, but not acted upon till the final report of the Finance Committee should be received. He fully appreciated the motives which prompted Mr. Blake in desiring to have his name withdrawn, but hoped his motion would be sustained.

Mr. Blake stated that the object which had induced him to permit his name to be used was that he understood that it was proposed to make the Commission take an active part in encouraging emigration from Europe to California—an object which, to carry out, would involve a considerable expenditure. But as it appeared from the remarks of the chairman of the Finance Committee, that the people of the State did not take much interest in the matter, it had been abandoned, and consequently he wished to withdraw his name from the list, as he did not desire that it should be supposed that he wanted to collect funds for his own use.

After a lengthy discussion of the matter, during which Mr. Tay filled the chair, at the earnest request of all the members present, Mr. Blake consented to allow his name to remain on the list.

## CONTRIBUTED FOR OUR CABINET.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

132—A "Hair Ball" from the stomach of an ox. This ball is in the shape of an oblate spheroid, and weighs, perfectly dry, 10 ounces. Its greatest circumference is seventeen inches, its smallest circumference, fifteen inches. Its greatest diameter is  $5\frac{1}{4}$  inches; its smallest,  $3\frac{1}{4}$  inches. Its size is larger than is usually met with. It was taken from the stomach of a three year old ox, which, when killed, was apparently sound and healthy, and was killed for beef. It was sent to us by Mr. D. B. Rickey, of Ione Valley, Amador county.

Accretions of this kind are frequently found in the stomachs of ruminating animals. We believe they are always found either in the first stomach or paunch, or in the fourth, which is the last stomach. They are generally round, or nearly so; but sometimes take quite irregular forms, and weigh, when first taken out, from a few ounces to six or seven pounds. The largest portion of this weight, however, consists of water, which soon evaporates, as in the specimen before us. These accretions are composed chiefly of hair, mixed with a little straw or other fibrous material, and are usually built upon some hard substance, as a small piece of wood, a bit of shell, a small stone, and sometimes a piece of iron. In the specimen before us, several small splinters of wood, which the animal failed to digest, evidently became entangled with coarse hair, which formed the nucleus around which the aggregation was built up.

In the process of this aggregation, the hair is matted very firmly and held together by the mucous secretions of the glands of the stomach. They are often built up with a succession of concentric layers, interlaminated with a mixture of calcareous, silicious and other earthy matter. When found, this matter usually covers the outside with a soft, smooth, shell-like coating, of a dark or light brown color, which hardens on exposure to the atmosphere.

They are sometimes found in very young calves. The hair finds its way to the mouth and from thence to the stomach, by being removed from the bodies of the animals in the process of licking themselves and each other. Their formation occupies a long time, generally several years. They sometimes begin to form at a very early age of the animal, and, of course, continue through their after life. They are sometimes so firm and contain such an amount of earthy matter, as to be capable of receiving quite a polish, upon their sectional surface when sawn asunder.

These accretions are not supposed to be especially injurious to the health of the animal except when they occupy the fourth or last stomach, and attain to a considerable size. Under these circumstances, the animal will generally be found ailing and out of condition—if a working animal, unfit for vigorous service. They doubtless produce in the animal a source of oppression and impairment of appetite; but it is not supposed that they produce colic, obstruction, inflammation or strangulation of the intestines.

**MONTE DIABLO COAL.**—Greenhood & Newbauer received from their mine at Mount Diablo, 460 tons of coal in one day during the past week. They have two shafts in their mine—one perpendicular and the other inclined. They are about 700 feet deep. The coal is raised by steam power; it is then conveyed by the railroad to Pittsburg Landing, and shipped by small vessels to this city, carrying from 100 to 200 tons each. In this mine they employ about 225 men.

The gold excitement in the northern counties of Georgia, is said to be on the increase. Sales of mines have been made at high figures.

**CALIFORNIA PRISON COMMISSION.**—The objects of this association are, as stated in its constitution, the "amelioration of the condition of prisoners," the improvement of prisons and prison discipline, and the "aid and encouragement of discharged prisoners, when such encouragement shall seem wise." The first Annual Report has been handed us. It contains a history of the organization, and the reports of its officers for the past year. That of the General Agent is especially worthy of mention. Examples are given in illustration of the duties which the agent has had to perform. Suggestions are made for improvements in the County Jail, which seem to be needed. The want of a "House of Correction" is especially urged; in order that those offenders who are not hardened, but whose one crime is of a certain grade, can be taken care of, without subjecting them to the stigma which popular prejudice attaches to the name of "State Prison Convict." Other suggestions are made, but our space does not permit us to enlarge upon them. No one can read this report without feeling that the institution ought to be encouraged in every way, by every good man.

"EVERY DAY LIFE" is the title of a new San Francisco monthly, which has just presented itself for public favor. It is published by Desty & Wright, under the editorial charge of Mrs. Washington Wright, better known in this community as "Topsy Turvy," or "Carrie Carlton." The initial number, which comprises forty-eight pages, opens with a Christmas story in rhyme, by the editor, and is well filled with interesting original miscellany. A new feature, for a California magazine, is an illustrated Fashion Department. The editor expresses the intention of making the magazine "as nearly 'just the thing that's wanted' as possible." There is room in California for a publication of this description, and we trust the publishers will receive such encouragement as will enable them to make it what such a publication should be.

**PATENT SIDING.**—Our attention has been called to this article, letters patent for which are held by Edward Nunan, master builder, 319 Pine street. It is manufactured from  $\frac{1}{4}$ -inch by 5-inch lumber, by grooving and slitting, the same as common siding. It does not require  $1\frac{1}{2}$ -inch lap, like common siding, but has the lap to every  $4\frac{1}{2}$  inches that rustic siding has to every nine inches, thereby allowing much more than the latter for shrinkage. The advantages claimed for this siding are, first, it is thicker and lies solid to the studding; second, it is superior to inch rustic siding, owing to the liability of the latter to split and shrink from the lap, on account of its great width; third, it is cheaper than common siding, on account of the great saving of laying. This siding is for sale in the different lumber yards in this city.

"THE PACIFIC LAW MAGAZINE," Vol. I. No. 1, has been laid upon our table. It is a pamphlet of about ninety pages, edited by Nathaniel Bennett and John W. Owen, counselors at law, of this city, and will be issued on the first of every month. A portion of the magazine will be devoted to original essays on some subject connected with the law, decisions of the courts of other Pacific States and of the United States, and abstracts of recent decisions of English courts, etc. Another portion will be composed exclusively of decisions of the Supreme Court of this State, with notes. It can be had of H. H. Bancroft & Co.

**THE INTERNATIONAL OCEAN TELEGRAPH COMPANY,** to which Congress at its last session granted the exclusive right for fourteen years to lay a cable from Florida to the West Indies, has obtained a similar grant from Spain, and will soon commence laying a line from Key West to Havana; they will also lay one to Jamaica, and thence to Panama.

**EIGHTEEN HUNDRED AND SIXTY-SIX.**—J. H. Carmany has published in pamphlet form the very complete and elaborate Review of the Year 1866, which appeared in the *Mercantile Gazette* of January 9th. It contains a summary of mining operations on the Pacific coast, and of the financial, commercial, agricultural and manufacturing interests of this State. It will constitute a most convenient and valuable book of reference, and is well worthy of a place upon every desk.

**THE MISSION WOOLEN MILLS COMPANY** had on exhibition on Thursday, at the Mission Dolores, the splendid assortment of goods of their manufacture, which will constitute their contribution to the Paris Exposition. Many of the city notables were present. The show was one which Californians may well be proud of. It has been fully noticed in the daily papers.

**ROBERTSON'S RAILROAD TRACK-LAYING MACHINE.**—It is said that a company has been formed in this city for the purpose of building one of these machines, and bringing it before the public here. We are glad that it is to be done by California capital.

**CONCENTRATORS.**—Messrs. Hineley & Co. of the Fulton Foundry, have received an order from K. S. Woolsey & Co., of Prescott, Arizona, for one of Hendy's Concentrators. One of these machines mentioned in our last issue, was for the "Empire," instead of Hueston mill, Grass Valley.

**ARIZONA.**—An article, giving a descriptive list of all the mills in Northern Arizona, together with much other valuable information, is crowded out of our present issue, but will appear next week.

**THE Commissioner of Agriculture** says that California claims a surplus of breadstuffs sufficient to supply the entire New England population.

**THE French Lieut. Bennis's breech-loader** has been much admired by Louis Napoleon, who has ordered experiments to be made with it.

**BUSY ESTABLISHMENT.**—Palmer, Knox & Co., of the Golden State Iron Works, are at present obliged to run their machine shop until 10 o'clock P. M.

**THE Londoners** are taking up the science of aerial navigation. A society has been organized for the purpose of experimentation on the subject.

**FIVE FIFTEEN-INCH GUNS,** for the fortifications around the bay, were landed, a few days since, from the ship Kingfisher from Boston.

**A GENERATION** has passed away since the first bale of cotton was sent from America to England.

**THE window glass and bottle manufacture** in Pittsburg employs eighteen hundred men and boys.

**TOWNE & BACON, Print—**  
Stock Certificates,  
Assessment Receipt Books,  
Transfer Journals,  
Circulars,  
Hand Bills,  
Cards,  
Billheads,  
And every kind of Job Work that may be desired.

**MACHINERY OIL**  
IS SUPERIOR TO ANY IN USE, AND IS WARRANTED NOT TO GUM.  
**Dell, Cranna & Co.,**  
511 1-2 and 513 Front street, San Francisco  
IMPORTERS OF  
**COAL OILS AND LAMP STOCK.**  
2v12-3m5p

**ANOTHER VICTIM.**—James Hanley, a New Granada prospector, died recently at Samanago, on the River Patia. He started two months before he died to prospect another river, in company with the Governor of the State and another. They succeeded in discovering some very rich mines at a point above where it had ever been prospected. But the climate was frightfully malarious, and Mr. H. fell a victim to it.

## STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

### Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the stone, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.  
Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v14d

## A Review of the Year 1866!

Containing an elaborate Resume of the  
**MINING OPERATIONS**  
OF THE ENTIRE PACIFIC COAST,  
Together with a complete Summary of the  
**Financial and Commercial Interests**  
Of this City and State, and other Statistical Information  
pertaining to Agriculture, Manufactures, etc. Also,  
articles on Banks and Local Insurance Companies; Mining Stocks; Treasure Product; Merchandise and  
**Produce Markets;**  
Average Prices of Leading Articles, etc., etc.  
Will be ready for transmission East by the next Steamer.  
**Single Copies, - - - - - 75 Cents.**  
**Ten Copies, and over, - - - - - 50 Cents.**

Compiled from the "Mercantile Gazette and Prices Current" of January 9th, 1867.  
**BY JOHN H. CARMANY,**  
Editor of the San Francisco Weekly Stock Circular.

## A. S. Hallidie & Co., MANUFACTURERS OF FLAT & ROUND WIRE ROPE, For Mining, Shipping, Ferry, AND GENERAL PURPOSES.

Office—412 Clay street. . . . . Works—North Beach, SAN FRANCISCO.  
**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.  
The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and many of whom we refer those interested as to the great advantages over any other kind of rope, effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.  
Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.  
We manufacture of all sizes, and in any length—  
**Round Wire Rope**—Iron or Steel, for Hoisting.  
**Flat Wire Rope**—  
**Soft Steel Wire Rope**—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, (saying in freight for remote localities). Suitable sheaves and blocks furnished when required.  
**Galvanized or Ungalvanized Round Wire Rope**—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.  
**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.  
**Iron and Copper Wire Cord**— $\frac{1}{2}$  to  $\frac{3}{4}$  inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps, Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.** Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Pac, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractory Curve Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Porter's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Bectors of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Fans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BOILING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRISCOTT. IRVING M. SCOTT.

Worms, etc., etc.  
Manufactured to Order.  
Old Boilers Repaired.  
B. CAMERON.

PROSPECTING EXTRAORDINARY.—A New  
York correspondent of the *Erie Dispatch*  
tells the following:

Several years ago, a German Jew, named  
Schwartz, spent three days in searching the  
sewers of New York for valuables. He picked  
up some \$27,000 worth of jewelry, etc., but  
having lost his way during the trip, and re-  
covered it with difficulty, he could not be  
induced to repeat the experiment.

A few days since, a Miss Walker, a young  
lady of eighteen years, who lived with her  
brother, aged sixteen, in a garret, which  
they had occupied since the failure and  
suicide of their father, an unsuccessful gold  
gambler, saw the account of Schwartz's ad-  
venture in an old paper which was wrapped  
around a parcel which she was taking home  
from a sloop-shop. She resolved to under-  
take the same thing. A map of the city was  
first carefully studied. She then, with her  
brother, and a man named Grady, formerly  
in her father's employ, started in for a  
week's journey. The result of their labors  
was valued at one million five hundred  
thousand dollars! One diamond ring was  
alone worth sixteen thousand dollars. Grady  
was lost in the labyrinth, and is supposed to  
have perished.

Tough, ratherishly, we should say!

#### FEVER AND AGUE—EXHALATION OF PLANTS.

The following is confirmatory of the views  
of Dr. J. M. Salisbury, which we have al-  
ready given in a previous issue, and in re-  
gard to which we quoted from the *Journal of*  
*Medical Science* in our paper of Dec. 29th.

"In 1843," says Dr. Hannon, Professor  
of Botany in the University of Brussels, "I  
studied at the University of Liege. Pro-  
fessor Charles Morsen had created in me  
such an amount of enthusiasm in the study  
of the physiology of the fresh water algae,  
that the windows and mantelpiece of my  
chamber were encumbered with plates filled  
with *Vaucheria* *Ascellator* and *conferve*.  
My preceptor said to me: 'Take care at the  
period of their fructification, for the spores  
of the algae give intermittent fever. I have  
had it every time I have studied them too  
closely.' As I cultivated my algae in pure  
water, and not in the water of the marsh  
where I had gathered them, I did not attach  
any importance to his remark. I suffered  
for my carelessness a month later, at the  
period of their fructification. I was taken  
with shivering; my teeth chattered; I had  
the fever, which lasted six weeks."

AGENTS from Cincinnati and other points,  
are traveling through the South for the  
purpose of buying up all the railroad iron  
which was torn up and damaged during the  
WAR.

satisfaction in every particular. 25v12-3m

**SILVER PALACES.**—Three magnificent sleeping cars, called "Silver Palaces," have been put upon the New Jersey Central Railroad. The following is the description given by the *Guide*: The wood work throughout is polished black walnut, with ornate silver mountings, each section being divided from its neighbor by a slender pillar of solid German silver. The panels are studded with silver medallions, and the arms of the seats and frames of the mirrors are ornamented with the same material. Mirrors are placed within each section. The interior is lighted not only in the usual manner, but through ground glass panels of delicate design which form the sides of the elevated ceiling. Thus lighted, and the light reflected by the mirrors and the polished silver fittings, the effect is fine. The carpeting and cushioning are of course in keeping with the luxury around them. In each car is a separate stateroom for the accommodation of a party, under special circumstances. This is also handsomely fitted, and offers the comfort of privacy if desirable, or can be thrown open when its inmates prefer being social.

McDonald & Co., San Francisco; and at retail by all respectable Druggists and Grocers. Price, \$1. 2v14t 10p

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call special attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

Has had five years steady and successful experience in working quartz in Washoe, and is practiced in saving shareholders and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address P. M. SHAW, San Francisco, care Mining and Scientific Press. 14v13 1m

## CONNECTICUT

## Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

## THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Business,  
The Largest Income.

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT of the premiums paid during the year ending 31st of January, 1886.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which are—

**Whole Life Policies**, by a continued annual life premium.

**Whole Life Policies**, by TEN annual premiums.

**Endowment Policies**, by a continued annual premium.

**Endowment Policies**, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

**Endowment Policies**, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

**None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.**

San Francisco. 17v13 p11

## Accidental Insurance!

## The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

### ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

### SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month,	2-10.	4 months,	5-10.
2 "	3-10.	5 "	6-10.
3 "	4-10.	6 "	7-10.

### GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices throughout the country.

They make Insurance for \$5,000, and \$25 per week compensation, against Accidents of every description, Traveling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance" in which the assured may at the time be traveling, but they are GENERAL ACCIDENT TICKETS.

### SEA VOYAGE POLICIES

Are issued, covering the risk of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

### INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend it its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

General Agents for the Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets,  
San Francisco. 17v13

## Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

## Professional Cards.

Operating rooms, Crim House, 523 Kearny street, between Sacramento and California. 21v13m

OWING to its general circulation, the MINING AND SCIENTIFIC PRESS has perhaps been as valuable and useful to the mining interests as that noted paper, the London "Lancet," was to the medical profession, acting either as a scarifier when too great a plethora of mining bubbles prevailed, or as a styptic where dangerous bleeding of the pockets of the capitalists was concerned.—[Copperopolis Courier, Oct. 13]

## City College Laboratories,

Southeast Cor. Stockton and Geary sts.

Practical and Analytical Chemistry  
and Metallurgy.

THOMAS PRICE,  
Professor of Chemistry,  
(Formerly of the Normal College, Swansea.)

WILL GIVE PRACTICAL INSTRUCTIONS IN QUALITATIVE and Quantitative Analysis and Assaying. The course qualifies students for the application of Chemistry to METALLURGY, MANUFACTURING ARTS, and MINING PURPOSES.

PHARMACEUTICAL and TECHNICAL CHEMISTRY, such as is required by Medical and Pharmaceutical Students, will be taught to such students as may require it.

Course of General Chemistry.

Evening Lectures will be delivered every Tuesday, at half-past seven o'clock, P. M., in the Philosophical Hall of the College, without extra charge to the students in the Institution.

On and after the 14th of February, the Laboratories will be open every day, except Sundays, from 8 A. M. to 5 P. M. For further particulars, address

REV. P. V. VEDER,  
Principal of the City College.  
6v12-20v1f Or at 403 California Street.

## New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents,  
San Francisco, May 1st, 1866.

**American and Foreign Patents.**—Letters Patent for Inventions can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Metallurgy.

WILL CONTRACT FOR THE  
**PURCHASE OF COPPER ORES.**  
Assaying eight per cent. and upwards of Copper to the ton.  
We will make advances upon Ores of Copper.  
San Francisco, Post Office Box 1259. 22

EUROPEAN  
METALLURGICAL WORKS,

—AND—  
Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphurets, pyrites, and the so-called "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

S. F. KIMBALL, J. R. MURPHY,  
10x14

MOSHEIMER'S  
Metallurgic Works

And Practical School for Assaying  
and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLURGIC Works, and is prepared to reduce any kind of Ores, by Smelting, Amalgamating, or other processes, that the nature of the ore may require.

Practical instructions given in Assaying, all branches of Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating Ores, I can offer better concentrating machinery than any in use in California, and especially such as will save the fine or floating gold and sulphurets.

CONSULTATION OFFICE:  
423 Washington street, San Francisco.  
J. MOSHEIMER,  
26x13 3m Engineer and Metallurgist.

## New Mining Advertisements.

## Arizona Consolidated Mining Company, Eucla District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1867, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, at the office of the Company, No. 611 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. W. BUNNELL, Secretary.  
Office, No. 611 Clay street, San Francisco. 14x9

## Big Blue Lead Gold and Silver Mining Company, C.ve District, Kern County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of January, 1867, an assessment of ten dollars (\$10) per share was levied upon the capital stock of said Company, payable January twenty-sixth, 1867, in United States gold and silver coin, to the Secretary, M. G. Elmore, at his office, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twelfth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. G. ELMORE, Secretary.  
Office, 302 Montgomery street, San Francisco. 14x9 5w

## Evoca Consolidated Copper Mining Company, Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of January, 1867, an assessment of twenty-five cents (25) per share was levied upon the assessable capital stock of said Company, payable on the eleventh day of February, 1867, in United States gold and silver coin, to the Treasurer, A. E. Thayer, at the office of the Company, at No. 532 Merchant street, Room No. 3, in the City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twentieth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirteenth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. S. CLYDE, Secretary.  
Office of the Company, No. 532 Merchant street, Room No. 3, San Francisco, California. 14x9 3

## Hope Gravel Mining Company, Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1867, an assessment (No. 12) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable on the seventh day of February, 1867, in gold coin of the United States, to David Wilder, Secretary, at the office of the Company, No. 529 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-third day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.  
Office, No. 529 Clay street, San Francisco, Cal. 14x9 5w

## Josephine Copper Mining Company, Location of Works: Copper District, Calaveras County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-eighth day of November, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

4v12

HUNTER'S  
IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ore will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the UNION FOUNDRY, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as follows:

The pan being filled, the motion of the muller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and setters for themselves, at the  
PACIFIC FOUNDRY,  
1v1 San Francisco.

BRUCKNER'S  
Mechanical Roasting Furnace

AWARDED A

PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
19v12 416 Market street, San Francisco.

Notice to Miners,  
Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing work.

M. PRAG,

Stove Store, No. 125 Clay street, below Davis.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1—Or 14-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—Price, \$600  
No. 2—Or 15-inch Crusher, capable of similarly putting through live to six tons per hour..... \$850  
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Raywhite Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Raywhite Ranch" Mine, in Tuolumne County: "Raywhite Ranch, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Raywhite Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, Supt. Raywhite Ranch Quartz Mill."

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel. A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. The following testimonial respecting the effectiveness of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866. BRODIE & KADOLFF, Express Building, 402 Montgomery street, San Francisco.

12v13f

PATENT HYDRAULIC HOSE SEWING  
By S. HOWARD,

Three seams sewed with twenty-ply Twine, are guaranteed to stand the pressure of a 200-foot fall. Twelve, five cents per yard.

One to three-ply Hose made. All orders promptly attended to. ADVANCES MADE TO ORDER, OR REPAIRED AT SHORT NOTICE. —

The Company have superior facilities for supplying the constant demands of the market. Country Orders punctually attended to. 19v13-q

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ore, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

1v14-3m JAMES HITCHENS.

## FOR SALE!

## QUARTZ AND MINING MACHINERY

ONE GARDNER'S THUNDERBOLT CRUSHER, LARGEST size and best quality; is entirely new, with all extras—with a large lot of other Quartz Machinery, including Engines, Boilers, etc. 16v13 COFFEY & RISDO

## Job Printing Press for Sale—\$250.

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, can be had for \$250, cash—lowest price. Warranted. Apply to NEWBY & CO., Mining and Scientific Press Office.

Economy in Advertising.—THE MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

## Earthquake in Klamath.

A letter from the Quartermaster's clerk at Fort Klamath, written by order of the commander of the post, dated January 8th, contains the following:

This morning, at daylight, we were startled from sleep by a precipitate shock of an earthquake, immediately followed by a noise as of distant thunder; but in a little while quiet reigned, and every one was conversing and laughing heartily at the singular phenomenon. But our countenances soon underwent a serious change; for it began to grow dark, and the whole heavens were full of a very black smoke or cloud; the air had a sulphurous smell, and ashes of a brownish color fell as fast as I ever saw it snow. We had to use caudles in the mess room. The most of us went into breakfast, but had only got fairly into our seats, when horror upon horror, the earth seemed rolling like waves upon the ocean; every one was thrown to the floor, only regaining their feet to be placed in the same position, with the rattling of dishes, crashing of glasses, cracking of timbers of buildings, and the screams of the frightened boys—you could not imagine a more perfect chaos. Some of us gained the door, and such a sight met our gaze. The tall pines around the Fort seemed lashing themselves into fury; the wagons in front of the stable were engaged in a pitched battle; horses and cattle were lying crumpled upon the ground and uttering the most pitiful moans; dogs were howling, and the unearthly yells of the Klamath Indians, camped near the Fort, completed the whole affair. We imagined we were amidst the wreck of matter and the crash of worlds. The sutler's store was thrown about twenty feet from its former position. There were no lives lost, and no serious accidents to any one. Quite a number retain bruised shins and skinned noses; no very serious damage was done to any of the buildings, all being log and frame houses, but I do not think there is a whole pane of glass left at the post. A continuous dark volume of smoke is seen ascending in the direction of Klamath marsh. There was about half an hour between the first and second shocks, the first being barely perceptible. The second lasted as near as can be judged, from various opinions, from two to three minutes.

A postscript adds: Mr. Whitmore has just arrived at the Agency and reports that the lake has lowered about six feet, and is still falling. Crooked Creek, a stream between this place and the Agency, has dried completely.

Although the country in that region shows traces of extinct craters, there is no tradition that any of them have been active during the historical period. But Mount Hood, 275 miles north, has been smoking more or less for the past two months. Mount St. Helena, and Mount Baker, have for some time shown similar signs at intervals. A smart shock of an earthquake was felt about a month ago at the Dalles.

AMERICAN ARMS IN EUROPE.—A Paris correspondent says a formidable American rival to the terrible needle gun of Sadowa seems to have already presented itself. Lieutenant Lamson, of the United States army, has had a lengthened interview, by special appointment, with the Emperor, to exhibit and explain to him the breech-loading magazine gun, of Mr. Ball, of Vermont. The result of the interview and the examination of the weapon, were in every way satisfactory and flattering to the American inventors, and that there can be little doubt that the French army will soon have this new production of American military genius placed in its hands. For three months and a half the Swiss Government has had a committee of experienced gunsmiths and army officers at Acrod, engaged in experimenting on the different systems of improved modern muskets, and that committee has just recommended to the Government to introduce the American Winchester rifle into the whole army. This is simply the Henry rifle, somewhat modified by Mr. Chapin. For a long time the Prussian needle-gun was in favor, but the Winchester, coming in last of all, carried off the palm among no less than 150 models offered.

THE survey for the Western Pacific Railroad route, between Stockton and Sacramento, is completed, with the exception of nine miles.

IN NEVADA COUNTY only one hundred feet on a quartz lode is allowed to a locator; such was the miners' law adopted in 1852, which has never been changed.

**ARTILLERY EXPERIMENTS.**—A Fortress Monroe letter of the 14th December has the following:

The experiments under the direction of Col. T. G. Baylor, commanding Fortress Monroe Arsenal, to test the endurance of 8-inch and 12-inch rifled Rodman guns, pursuant to the recommendations of Secretary Stanton, have been commenced here with determined energy to apply the proposed test most thoroughly, and to accomplish decisive results for the future guidance of the Government in the use of heavy ordnance. Thus far the firing has been with the 12-inch rifled gun, originally known as the Floyd gun, after that called the Lincoln gun and afterwards the Union gun, which name it goes by at present. This gun was cast in Pittsburgh, Pennsylvania, and, as is well known by the thousands who have seen it, is a monster in size, weighing over twenty-six tons. The charges weigh fifty-five pounds each, and the projectiles used, known as the tiger projectile, weigh about six hundred pounds each. Up to the present time this gun has been fired about four hundred times, and it appears as strong as ever. It is proposed to continue the firing to \$1,000 times, unless it should explode or become unserviceable before the number of shots have been fired. In the 8-inch gun the charge weighs fifteen pounds and the projectile about one hundred and fifty pounds. The gun of this caliber to be tested has been here several months and has already been fired some three hundred and fifty times. It is proposed also to fire this one thousand times if the gun proves equal to the test. The experiment will last several weeks. These proposed tests are connected with the late iron clad target practice, and comprise part of a series of most interesting and valuable artillery experiments which the Government has wisely inaugurated on the very judicious defensive maxim, "in time of peace prepare for war."

**GOLD PROSPECTORS IN SOUTH AMERICA.**—A party of Oregonians has been organized to go on a prospecting tour to Ecuador, South America. The names of the prospectors are M. M. McKean, Geo. McKean, S. Marcy and H. Warren. A number of the citizens of Grant county are interested in the enterprise. The party are all experienced miners. Mr. Marcy was in the region they design exploring last year, and found some rich specimens, which he brought with him.

The inventor of the needle-gun has now made a needle cannon. A six-pounder is said to have made good shooting at 2,000 paces.

#### MELLVILLE C. KEITH, M. D.

**Homeopathic Physician,**

#### Our Patent Agency.

The PATENT AGENCY OF THE MINING AND SCIENTIFIC PRESS has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

#### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is effectually rubbed by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

By a combination of the movement of the ball and socket, and the movable arm, any desired angle may be obtained. Call and examine for yourselves. A liberal discount to the trade. SHEPARDSON & GATES, Agents.  
22v13-3m Corner Sansome and Commercial streets.

#### Rheumatism!!

#### Still Another Witness!

LATHROP, Cal., Sept. 19, 1885. }  
(White Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief. About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably puts it to flight. I therefore cordially recommend it to the afflicted as an untailing remedy for Rheumatism. FRED'K. FABER.

Richard's Remedy is for sale by  
H. BOWMAN, Druggist, Sacramento.  
And by Druggists generally.

General Agent, 111 Montgomery street, San Francisco.

17v13

**PHOTOGRAPHY APPLIED TO SCULPTURE.**  
We have already alluded to this new application of the photographic art, and will now give a brief description of the process: The operating room has twenty-five sides, all of glass, in the middle of each of which is a camera. These twenty-four cameras are so arranged that all can be closed and opened simultaneously. In the center of the room is a platform for the sitter. The picture is taken in the ordinary way, and the operator is in possession of twenty-four negatives, which are a complete series from the full face round to the full face again. The mass of clay to be molded is divided by vertical lines into twenty-four sections. Each of the negatives, after having been reproduced of a magnified size, is set up before the section answering to it. The pantograph is then brought into use. This is simply a rod, with one end pointed and the other furnished with a scraper. This rod is suspended in a frame. It is precisely like the rods used thirty years ago to take "profiles," except that it has the scraper instead of the pencil. It is easy to see, without further description, how the scraper is made to shape each of the twenty-four sections on the clay mass in turn. The artist then puts on the finishing touches with his chisel.

**NEW PROCESS FOR DESULPHURIZATION.**  
The Nevada Transcript of January 11th has the following:

W. R. Oliver, of Forest Hill, is in this city, introducing a process for desulphurization, for which he claims almost magic powers. He says he can work a ton of the most refractory sulphurets in from one and a half to two hours, extracting in that time all the precious metals. His process has been used in several of the cement mills in Little York township. He has sold 453 receipts, and claims that he can satisfy any man of the efficacy of this method. If it does what he claims for it, it should be possessed by every man in the State.

We should be glad to hear from some of Mr. Oliver's purchasers in regard to the result of their experiments with his receipt. It has occasionally happened, we believe, that the buyers of receipts have finally discovered that there were two sales made when the bargain was consummated. We trust this is not the case in this instance.

**WHALING** is carried on to some extent in the vicinity of San Pedro. The whales are easily captured when they approach the shore and become entangled in the kelp. So says the Wilmington Journal.

The various petroleum stills in this city have a joint capacity of about 100,000 gallons monthly.

### EXCELSIOR

**Double-Acting Suction and Force Pump.**  
Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or  
1am  
**CUSHING & CO., Prop'rs, San Francisco.**

### Consumption Cured.

Fulton, Hamilton Co., Ohio, May 19, 1863.—Gents: This is to certify that my daughter was taken with a severe cold, which settled upon her lungs, attended with violent coughing. The cough became incessant and distressing, with pain and great difficulty of breathing. It went on until chills and night sweats set in, when she raised large quantities of phlegm and matter. The attending physicians examined her, and said that they thought one of her lungs was almost gone, and that they believed she could not be cured, as she had the last stages of consumption. At this time she was induced to try ALLEN'S LUNG BALM, having heard of its many remarkable cures. On using the Balm, it seemed to go to the very seat of the disease at once, as it caused her to expectorate large quantities of phlegm. The cough began to mend; the soreness of the lungs was relieved; the strength and appetite returned. By the use of only three bottles, she, to all appearances, had recovered her health, and now feels as well as ever.  
Respectfully yours,  
LUCIUS PECK.  
Sold by all Medicine Dealers every where. 1v14-1m

A splendid paper, and should have a good list of subscribers in prosperous Grass Valley.—[G. V. National.

**Important to Californians.**—Many inventors have lately had their claims for Patents seriously (and in some cases fatally) delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the requirements of the Department, and properly filed all necessary papers as Claim Agents.

**CHANGING THE ADDRESS.**—No charge is made for changing the address of this paper. To give all necessary information, write us plainly as follows: "Change address of the Mining and Scientific Press from Mr. .... at .... P. O., .... County, .... State, to Mr. .... at .... P. O., .... County, .... State, .... 186-." 1am1s

## REGULAR MEETING.

SAN FRANCISCO, Jan. 21, 1867.

President in the Chair. Twenty-three members present.

Governor R. C. McCormick of Arizona, and R. C. Jacobs of Chihuahua, were elected corresponding members; and Messrs. J. W. Kidwell, A. S. S. Mason, H. C. Bidwell and H. P. Carlton, were elected resident members.

Messrs. C. Von Liebenau, L. Gilson, Delos J. Howe, R. S. Williamson, R. d'Hereuse, Rev. J. F. Harrington, H. C. Hyde, G. B. Hitchcock, Jacob Bacon, J. P. LeComut, Amory F. Bell, W. C. Walker, Dr. Geo. H. Powers, and Dr. Thos. Bennett, were proposed for resident membership.

**Donations to Library.**—A large number of publications, principally proceedings of European Scientific Societies, received through the Smithsonian Institute.

Dr. A. Kellogg read a communication concerning the identification of certain specimens of a plant exhibited by him. This plant was held in esteem as a cure for chronic rheumatism, and might be mistaken for the *Sanicula* (*Sanicula*), or the Sweet Cicely (*os-moerhiza*), also quite harmless, or perhaps even for the deadly poison hemlock (*conium maculatum*), which grows abundantly in similar localities, as will be seen by Doctor Cooper's Report. This public notice of a plant not new, is the more important, because at least one case of poisoning has occurred, and if a careless or ignorant collector has sent hither other plants mistaken for the true one, serious mischief might result; the specimens examined are the *Thapsium Coradatum*, or the common heartleaf meadow parsnip.

Dr. Kellogg also presented specimens of a beautiful Alpine willow herb, collected by Mr. Blanchard, of Brooklyn, Alameda county, in the Kearsarge Mountains, Owen's River country, at an altitude of 8,000 feet. He considered it a variety of *Epilobium Obcordatum*, Gray; Pro. Am. Acad. Arts and Sciences for May, 1865.

Dr. James Blake read a highly interesting paper, concerning the singular manner in which the embryo of the Embryotoioid fishes receives the nourishment necessary to its growth.

Mr. Bolander exhibited the cones of many species of pines peculiar to this State, and gave many interesting facts concerning the peculiarities of the different species, and their geographical distribution. He stated that the pines of California comprise sixteen true species, which he described briefly. There are twenty synonyms for these species, which have created some confusion as to their real name and number. The correct names of all, with the popular characteristics of the most striking, and their

distribution, we give herewith. The names marked thus \* are those of trees having persistent cones, which they retain from ten to twenty years in some instances. Those marked thus † retain their cones but two years. Those marked thus ‡ throw a series of cones every year.

*Pinus Insignis*. \*—Well known as the ornamental Monterey pine, which is much cultivated in San Francisco.

*P. Muricata*. \*—Not remarkable.  
*P. Contorta*. \*—Small and bushy, but valuable for shelter against wind. Grows abundantly near Fort Bragg, in the Mendocino country, where it makes the stoutest wind-proof hedge known. Ought to be tried in San Francisco.

*P. Tuberculata*. \*—Always small, seldom higher than 15 to 30 feet.  
*P. Ponderosa*. †—The well-known yellow pine. Attains a height of 225 feet and more, and a circumference of 23 or 24 feet.

*P. Lambertiana*. \*—The equally well known, larger and handsome "sugar pine," or "long-cone pine" of Fremont. Usually grows at great altitudes; exceedingly valuable for timber, and afford the principal supplies.

*P. Coulteri*. †—Found in the lower eastern slope of the Coast Range. Not very large; sometimes attains a height of 75 feet; knotty, but ornamental. It is remarkable for having the largest cone of all the pines, and specimens of its cone, when first known, brought 5 guineas in England.

*P. Sabiniana*. †—This is the nut pine of the foothills, sometimes called the "scrub pine," or "silver pine." The Digger Indians gather the nuts from its cone as a favorite article of food. It is found on the foothills of both the Coast Range and Sierra Nevada.

Mr. Bolander mentioned several species in the group of coast pines which he had not seen, viz: *P. Llaveana*, east of San Diego; *P. Delflexa*, on the summit of the California Mountains; *P. Torreyana*,\* near San Diego.

*P. Monticola*. †—Affords a tall tree and fine timber, said to be harder than the sugar-pine, and might be preferred if its position near the Summit did not make it difficult of access.

*P. Flexilis*. †—This grows in the form of a low shrub on windy heights, so stout and thick that a man can stand on its top. In low altitudes it reaches a height of 100 feet. It is useful only for firewood.

*P. Monophylla*.—This is a stunted, twisted tree, which grows on the eastern slope of the Sierra, where it corresponds to the nut-pine on the western slope. At a distance it resembles in shape the live oak. Its cone is ill shapen and has an offensive odor, but yields a sweet nut.

*P. Balfouriana*.—This species is found near Scott's Valley, in Northern California.

Five species in the above list—*Insignis*, *Muricata*, *Llaveana*, *Delflexa*, and *Torreyana*—are peculiar to the sea coast. Five species—the *Contorta*, *Ponderosa*, *Lambertiana*, *Sabiniana*, *Tuberculata*—are found both in the Coast Range and Sierra Nevada. The *Coulteri* is found only in the Coast Range, eastern slope; the *Monticola* only high in the Sierra; the *Flexilis* only on the upper Sierra and lower slope of the same; and the *Monophylla* only on the eastern slope.

THE HORSE RAILROAD is peculiarly an American institution. George Francis Train endeavored to introduce it into London, but failed to convince Englishmen of its utility. It seems to have been better received on this Continent, having been successfully introduced into the city of Hamburg, where it is pronounced a great convenience to the public. A line was opened between that city and Wansbeck, four miles from Hamburg, which, during the first three months, conveyed no less than 330,000 passengers.

## THE COLOR OF MINERALS.

The light of the sun possesses many remarkable peculiarities. It falls on the clouds, and being reflected from them, they become visible. In falling upon terrestrial objects, it undergoes many remarkable changes. When reflected from certain polished surfaces, it displays various brilliant colors. The action of light upon minerals is a very interesting and useful study, and greatly aids the mineralogist in determining the nature of the mineral he has in hand.

Some minerals reflect the light thrown upon them, others absorb it. Minerals are called opaque, in contradistinction from transparent. Mica affords a well-known example of the latter. In most transparent minerals, the light is more or less reflected from a right line. This refraction is often double, when the object thus observed is represented as two fold. This phenomena is distinctly observable in Iceland spar; which is hence called "double refracting spar."

The colors of minerals originate as in other bodies, by a portion of the rays being absorbed, while those that denote the color of the mineral are reflected. Some minerals are colorless; that is, the rays pass directly through them without refraction. This is the case only when such minerals are perfectly pure, according to the essential character of their chemical combinations. When they contain impurities, they assume different colors, according as those colors are more or less absorbed, or as they reflect the rays of light. Rock crystal, which, when pure, consists of silica alone, is colorless; but it becomes yellow, red, brown or black by a very small admixture of iron or magnesium.

Some minerals exhibit one color only; others a great variety of colors. Fluor spar excels all others in this respect—being found red, enameled green, blue, brown, yellow and white. There are also minerals which display a variety of colors in the same specimen.

Who has not admired the color phenomena of the opal—which is hence called, wherever met with, *opalescence*. By presenting the opal at various angles with a beam of light, the same beam appears green, blue, red or yellow; the various colors at the same time constantly intermingling and interchanging with each other.

The luster of metals is a consequence of the various reflection of the rays of light which fall upon their surfaces. This luster, for convenience of observation and description, is graded into vitreous, metallic, pearl wax and oily luster, etc. Minerals destitute of luster are called dull.

Phosphorescence is another interesting and quite remarkable property of some minerals, intimately connected with light. It was first observed in a species of barytes, known as Bolognian spar. The discovery was accidentally made by a shoemaker of Bologna—hence the name of the mineral. Many minerals have since been found to possess this property. Such minerals, when exposed to the sun for a while, and then

placed in a dark room, emit a phosphoric light; the result perhaps of a gradual discharge of the electricity or magnetism they have gathered, during their exposure to that luminary, as the light very much resembles, what is known as the "magnetic brush," or glow of light from a magnet. This phenomena is especially observable in the diamond. Some limes and sandstones display the same phenomena when scratched. The pieces of quartz will emit a faint light in the dark, even under water, when rubbed together.

Fluor spar, powdered, exhibits a blue or green light, when sprinkled on burning coals or a hot iron. This appearance is also occasionally noticed when it is sprinkled into boiling water. Sometimes all the colors which this mineral manifests in its simple varieties, will appear in brilliant alternations, when powdered and treated as above. A very interesting and amusing experiment may be made in a dark room by sprinkling this mineral on a heated fire-shovel, or a flat piece of heated iron.

CALIFORNIA SILK GROWER'S MANUAL.—Mons. Louis Prevost has presented us with a copy of his manual for silk growers. It is a neatly printed book of nearly 250 pages. The first half of it is made up of the letters which M. Prevost has from time to time written to the various California journals on the subject of silk culture. These are republished in this connection, at the instance of friends who had read them as they appeared, with great interest; and they fully establish the fact that Mr. Prevost is entitled to the credit of being the pioneer in this culture in California. The remaining half of the volume is a complete hand-book for those who wish to engage in this business, and is especially adapted to California.

Mr. P. saw at an early day, that the State offered extraordinary facilities for this culture. He has for twelve years been giving attention to the raising of the mulberry; and for six years to the raising of the silk-worm. As soon as he had satisfied himself that it would be a success, he set about promulgating the fact. With a rare freedom from that narrowness which prompts so many men who think "they have got a good thing," to make the most of it for themselves alone, he has expended much time and money in laying before the public the result of his experience. Just such a persevering, enthusiastic, self-forgetting man as Mr. Prevost, was wanted to do this thing, and he has done it effectually. He will find his reward, not only in the enviable reputation of being the pioneer in what must inevitably become one of the chief resources of this Golden State, but also in the increased money-value of the landed property which he has set apart for the purpose of carrying out his favorite project.

FIVE HUNDRED DOLLARS is offered for an American silver dollar of 1804, if in a good state of preservation. The *Alta* has the advertisement.

EAR-RINGS to clasp, not pierce the ear, are now worn.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Light for the Mines.

MESSRS. EDITORS:—Every article consumed in our mines must be of some interest to you and your subscribers; also every improvement made which renders such articles better and cheaper. Two of our most indispensable articles in a mine are light and powder. I will dwell on the first in the present article, and the latter in my next.

The light generally used by our miners is that of candles; in other countries they use oil or gas—the former is the dearest, the latter the cheapest. Very few people have any adequate idea what a quantity of candles are annually consumed in California, the principal portion of which are used in mines. There are about twelve thousand boxes imported here per annum, and at least nine-tenths of them come from the Eastern States.

## WHAT CANDLES DO WE GET?

The article commonly used is the stearin candle, of an inferior quality. They are called adamantin candles, and have other various names; but in their composition they are nothing more or less than a tallow candle, partly freed from some of the olein contained in tallow. Taking into account the price of twenty to twenty-five cents per pound, at which they are sold, we shall find, by considering the relative amount of light they produce, that they are the most expensive illuminating material of anything in common use.

Beside the heavy expenses for the mine-owners to buy the article named, there is another and more serious consideration to be taken into account, and that is the offensive and unhealthy smoke evolved by their consumption in mines which are not well ventilated. It is hard enough where men work ten hours out of twenty-four, to be deprived, in the day time, of God's natural light; but it is still worse that they should be deprived of the air he has made free for all to inhale, and without which man cannot exist, by the same being poisoned with such unfit material for illumination as enters into the combination of most of our candles. But the question will be asked,

## HOW CAN THIS EVIL BE REMOVED?

The answer is plain. If you wish to use candles, huy none but the best; such as are made either of spermaceti, or pure stearic acid. Most of our candles sold as stearin, hardly deserve the name, as it will be found on analysis that only a small portion of the olein originally contained in the tallow is extracted, and therefore we have neither a pure stearin nor a tallow candle, but a mixture of the two.

The process of the manufacture of candles is so well known, that it would be superfluous to describe it at this time. I will confine myself to a few general remarks.

While I was at the London or World's Exhibition in 1862, candles occupied an important part of the show, and the most perfect article in that line was furnished by Austria. Among one hundred exhibitors, sixty-one made their produce by the old process of saponifying with lime; the remainder used various processes, consisting in the main of the application of high pressure steam—some with and others without the addition of sulphuric acid. The candles exhibited at that time far surpassed anything we generally see in our market; although since that time much progress has been made in this branch of manufacture. Especially is this true in Austria. The Austrians have the claim of superiority combined with cheapness; and it is to be hoped that the manufacturers who supply the California market will examine into these improvements, and let us have an article cheaper for the buyer, and healthier for the miner or consumer.

Tallow is worth in California eight cents per pound; candles twenty cents—leaving twelve cents for the manufacturers; the olein extracted from the tallow sells for seven cents; other losses may be set down at one cent; consequently, for manufacture, there is charged ten cents per pound. It can be profitably done for half the price. I would complain less about the price, however, if the articles were what they are named—a "Stearin Light;" but having lately, twice, bought candles sold for stearin, of such inferior quality that I could not use them; and knowing that our market is usually supplied with the same class of candles, I feel it my duty to call the attention of importers and the public to this fact, with the hope that some steps may be taken to remedy the

evil. One lot which I bought was full of lime—the other as full of sulphuric acid; both of them had Eastern brands on the boxes.

I have lately received some specimens of candles made in Austria, by a new process, and one which I think surpasses anything I have previously met with. I compared it with one of our common stearin candles, and found that the light was about one-third more intense, while its combustibility was much slower. These candles are made from tallow, like all stearin candles, but by the addition of nitric acid and starch. The process is simple and cheap, and it is to be hoped that some one will take up this useful branch of industry and give us a better and cheaper light. Any inventor who can produce a material saving of light or fuel, will be classed among the greatest benefactors of humanity.

In my next I shall give you some account of an improved gunpowder, and the experiments made with it by competent engineers, who have pronounced it a success.

J. MOSHEIMER,

Engineer and Metallurgist.

San Francisco, January, 1867.

## Ventilating Machines.

Translated for the MINING AND SCIENTIFIC PRESS, from the Berg-und Huettenmaennische Zeitung, of Nov. 12, 1866.

BY G. KUSTEL, M. E.

After different systems of ventilating machines had been employed for twenty years in the mines of Belgium, the centrifugal ventilators (fan blowers) have again come finally into favor. The faults of these ventilators were principally found: first, in the great speed (500 to 700 revolutions) connected with a fast wear; second, the low depression which could not be forced above a certain limit, without loss in effect beyond proportion; third, the small effective power, which was not over 0.25 to 0.24.

The new ventilators are distinguished principally by very large size, and some other improvements in construction, by which their effective power surpasses all other machines.

Among the different ventilating machines in use are principally to be considered: First, piston machines; second, ventilating wheels (Fabry's and Lemielle's), and third, centrifugal ventilators.

Mahan & Co's piston machine, yet in use in some mines near Charleroi, is a gigantic, horizontal machine, the square box of which is made of brick-work lined with wood. The piston moves the length of the piston rod back and forward. Two double-acting air boxes (like Nixon's\*) would be better. This machine agrees in main points with the horizontal cylindrical hellowers; but the arrangement is too cumbersome and expensive, losing at the same time too much air.

The rotating piston blowers of Fabry and Lamielle are mostly in use, especially Fabry's airing wheels, by which the highest effect, within certain limits, is attained, as compared with ventilators; but their effect is limited to an air quantity of from nine to thirteen cubic meters per second (17,550—25,350 cubic feet per minute), at a midling pressure of fifty to eighty meters, water column. Large dimensions of these ventilators are hardly practicable.

Of the centrifugal ventilators, four kinds are mainly noticed: Rittinger's, Lamher's, Gallez's and Guibal's.

In Rittinger's ventilator, the wings are so placed as to convey the air into their concave side. On the inner radius the wings are inclined backwards at about forty-seven degrees; on the outer they are nearly radial. Lambert's blower contains straight wings in a radial position. The ventilator is closed on one side; on the other, the circular opening (connecting with the soaking canal) is about nine feet in diameter. The circumference of the blower, revolving on a shaft, has eight narrow openings. Corresponding with these there are eight radial partitions inside, made of sheet iron; so that the wind, gliding on the partitions or shovels, finds its outlet. Gallez's ventilator has from twelve to sixteen curved wings, like the reaction wheels, about twenty-seven feet diameter, and surrounded by a mantle of bricks. Guibal's machine has eight straight wings, forty-five degrees towards the inner radius, backward inclined. The whole wheel is constructed of angle iron-pieces, with wooden wings, in a solid, simple, three-cornered combination. Its diameter is twenty-one to twenty-seven feet, face three to six feet.

Guibal's present ventilators have a diameter of eighteen to twenty feet, and four and a half to six feet face, receiving from thirty

to sixty, or at most ninety, revolutions per minute. It was found that from sixty to seventy per cent. effective power was obtained from the real power applied on the wing shaft. The steam engine of a simple construction gives, also, a high degree of effect, so that the effective power of the whole arrangement may be safely reckoned at 0.30 to 0.40. Using a powerful steam engine, the quantity of soaked air of a mine can be more than doubled in the shortest time, if necessary, in case of accidents.

## Quartz Mining in Central Arizona—List of Mills.

While, from passing over the old Butterfield stage route, Southern Arizona is comparatively well known to many Californians, the newly occupied part of that Territory, the great Central region above the Gila and east of the Colorado, which was not occupied by the whites until 1863, is not so well known.

Of this region we hear most encouraging reports. The mines of gold and silver are numerous, and the advantages of wood and water are remarkable, while the climate is favorable to labor at all seasons. In the face of much annoyance, owing to the inadequate military force (which is now being increased), the enterprising mine-owners have some dozen mills, within a circle of fifty miles of Prescott, and are confident of great results. We have been furnished the following list of these mills, and notes descriptive of their locality, the ores they are working or to work, etc.:

WICKENBURG.—At this point, fifty or sixty miles south of the capital town of Prescott, is the Vulture gold mine, an immense deposit of quartz, of which it is estimated that 10,000 tons lie above the surface. A 5-stamp mill has been in operation nearly two years, and is now paying better than ever. According to latest reports, the ore yields eighty dollars per ton. A 20-stamp mill is being erected by the Vulture Company, of New York (J. D. Cushenbury, superintendent,) and it will probably be completed in February. The engine is sufficient for forty stamps, and that number will be used if the ore continues to give a good return. The Vulture is not directly in a timber district, but it is thought that there is enough mesquit in the ravines about Wickenburg to supply fuel for some years. Water is abundant at the point where the mills are fixed, upon the Hassayampa river, some eighteen miles from the lode. Supplies are shipped from San Francisco, via Fort Yuma, to La Paz, on the Colorado, from whence there is an easy wagon road, a distance of 110 miles, to Wickenburg.

STERLING MILLS.—There are two 5-stamp mills on the Sterling gold lode, six miles south of Prescott. Only one mill is in operation, under lease to W. T. Flower, an experienced mining superintendent. Latest advices state that the ore is yielding \$100 per ton. The Sterling is a large lode, and its proximity to the capital, as well as the presence of abundant timber and water, makes it a desirable property. The ore is of a soft nature and shows much free gold. The lode is a large one, and in the vicinity there are other lodes of much promise, such as the Mechillo and the Umpqua. A 10-stamp mill has lately been sent from San Francisco for the latter.

LYNX CREEK.—This district, twelve miles east of Prescott, is noted for its rich placers, which were worked for several years with great success. It was on this creek that Uncle Joe Walker, the pioneer of Central Arizona, had his cabin. The first quartz mill (two stamps) was erected in 1865 by Bowers & Bro., merchants in Prescott, and situated at Fort Whipple. It is upon the Accidental gold lode, and, although of little account, has sufficed to prove the wealth of that lode. A larger mill is proposed, and there would seem to be ore enough of a rich quality to warrant it. Mr. Lamson, formerly of Gold Hill, Nevada, and well known in New York and San Francisco, in the spring of 1865 took two Little Giant engines and Thunderbolt crushers to Prescott. One of the mills was erected on Lynx Creek, to work the Boston and other gold lodes. It is understood that the crusher gave out after the first week of regular work, and that ten stamps have been ordered in its place, for which the engine would seem to have ample power. Messrs. Tyson and Coulter, formerly of San Francisco, have a 10-stamp mill on Lynx Creek, and are now working the Eureka lode. The ore is abundant, but somewhat refractory, and a change in the amalgamating pans has lately been made. Mr. W. C. Reed, who is also interested in the mill, went from here on the 15th with a process for desulphurizing, which he thinks will prove a success. Most

of the ores of Lynx Creek, yet worked, show sulphurets, but it is believed that they are all very rich and can be profitably worked. Lynx Creek is in a forest of pine and oak, and the water is never-failing.

BIG BUG.—Five miles east or south of east from Lynx Creek is Big Bug district, in which are certain lodes already well known in San Francisco, such as the Big Bug, the Galena, the Ticonderoga, and the Dividend. Borger's 10-stamp mill, owned by Borger, Wormser & Co., and Gray & Co., is one of the best in Central Arizona. Mr. Borger has spared no pains to make it perfect. The ores of the Big Bug and Galena mines have been tried, and a number of gold bars have been sent to San Francisco. It is thought that the Big Bug ores are very rich; but, like those at Lynx Creek, they have not yet been thoroughly tested. The second Lamson mill has been erected on the Ticonderoga lode in this district, of which Col. King S. Woolsey, the noted Indian fighter, is the chief owner, but it will not be put in operation until stamps are received, the Colonel having no faith in the crusher, after the result at Lynx Creek, where he is also largely interested. On the Agua Frio, in the Big Bug district, and near to his well-known ranch, Col. Woolsey has a 5-stamp mill running by water-power.

TURKEY CREEK.—This district is some thirty miles from Prescott, and abounds more in silver than in gold mines. A 10-stamp mill, sent out in 1865 by a Philadelphia company, and commonly known as the Vickroy mill, has, after long delay, just been put in operation upon the Bully Bueno gold lode. Major Coffin, late of the army of the Potomac, is in charge, and the company is said to be one of large means. The ore from this lode is of a curious character, the gold being found in hornblende, but it is considered very rich, and late reports are flattering in the extreme.

The Big Bug and Turkey Creek districts are well furnished with wood and water, and the mills have all been put up in good style, with commodious buildings and all necessary appointments.

This brief outline of milling operations in Central Arizona, while it is given too early to admit of the announcement of positive results to any extent, shows a degree of enterprise and confidence on the part of the people of that region which must be commended.

Our informant assures us that the practical miners from Nevada, Idaho and other Territories, and from this State, who are interested in operations in Central Arizona, speak of the prospects as better than those of any other district they have known at the same stage of development. They say that if such substantial progress has been made with constant Indian troubles, and extravagant expenditures for living and transportation, there will be no limit to the advancement when these obstacles are removed, and the great value of the lodes is proven, as they think it speedily will be.

The additional force of four companies of troops for the region about Prescott, secured by Governor McCormick, will keep the roads open, protect the mails, the mines, ranches and settlements, and do something towards the necessary aggressive war upon the Apache, although a larger force than has yet gone to the Territory will be needed for its proper prosecution.

The experiments in farming in Central Arizona have been very satisfactory. In his message to the last Legislature (September, 1866), the Governor says:

"The valleys of the Territory, more extensively cultivated this year than ever before, have produced an abundant harvest. The yield of corn, vegetables and small grain, is such as to prove that henceforth we need not look abroad for food; and I make no doubt that if assured that their crops will be bought and promptly paid for, and they are properly protected from Indian incursions, our ranchmen will, during the ensuing year, by the favor of Heaven, raise all the breadstuffs that may be required to subsist the military force in the Territory. Here in Central Arizona, even in the mountain districts, where comparatively little was expected in the way of agricultural success, the pursuit of the husbandman is likely to be one of the most profitable. The heavy rains of the present season indicate that irrigation will seldom be necessary, and the fertility of the soil is remarkable. It seems as though everything planted attained the most luxuriant and complete growth in the shortest possible time. The grains, vegetables and melons, taken promiscuously from any of the ranches, and raised without fertilization of any kind or other than the simplest care, would command a premium if placed in competition with the products of the richest and most expensive farms and gardens of the Atlantic States.

\*Nixon's machine is at work at the coal mines of the "Navigation Colony," South Wales. The pistons are twenty-two feet by thirty, the stroke seven feet.

## Mechanical.

## Superheated Steam.

Henry W. Bulkley, of New York, Engineer, in a communication to the *American Artist* of December 12th, speaks as follows of the use and economy of superheated steam: The higher the degree of superheating employed, the greater are the economical results, but not in a direct proportion. The greatest benefit of superheating results from the addition of the first few degrees of heat (say 50 degrees), when its expansion from the previous saturated condition is very great, as its surplus moisture is thus changed into pure steam. After the steam is thoroughly dried, any further superheating expands it as a perfect gas, doubling its volume by the addition of 480 degrees to its temperature. If steam could be used red hot its efficiency would be largely increased, but as with engines as at present constructed, it is not practicable or convenient to employ steam at such extreme temperatures, we are unable to realize the full economy of superheating. We may, however, evaporate the water it holds in suspension, and raise its temperature to 375 or 400 degrees in the cylinder, with the greatest safety, and effect thereby a saving in fuel of from 25 to 30 per cent. The practical experience of Mr. Bulkley in the use of superheated steam has convinced him of this.

An engine operated by moderately superheated steam works *livelier and steadier* (as there is no water in the cylinder) than with the mixture of steam and water commonly employed, making with it more revolutions, with a large reduction in the amount of coal used. The prejudice against the use of such steam is entirely unfounded, and as few will dispute, the economy attending its use, experience will convince all doubters that no reasonable objection exists to its universal adoption.

Care should be exercised in the employment of superheated steam, with ordinary appliances, that it is not raised above 400 degrees Fah.; as, when its temperature much exceeds that point, it becomes fatal to economy, by the drying action it exerts upon the lubricating material and for the valves and pistons. This, we presume, is one of the great difficulties in the way of the employment of superheated steam in Danforth's Generator; at least we were told that such was the fact in the experiments conducted with one of these generators in this city. We have heard nothing of late in regard to any progress being made in New York or elsewhere, with the Danforth Generator.

The largest kettle in the world is employed in the extensive soap and saleratus factory of Mr. B. T. Babbitt, No. 74 Washington street, New York. This kettle is fifteen feet deep by sixty-three in circumference, and is made of boiler iron. What is said to be the largest cast iron kettle ever made on this continent, was cast out at the Union Foundry, in this city, in the fall of 1861. Its weight was 9,114 pounds; its capacity 1,316 gallons. It was intended for soap boiling.

The art of welding iron is older than that of melting or casting it. By the early method of producing iron from the ore, it was turned out in the condition of wrought iron. The same method is still employed by the uncivilized natives of the interior of Africa and Asia. The iron so made is superior to that derived from cast iron by the puddling process now employed; but the process is impracticable on a large scale.

**REDUCTION IN THE PRICE OF PLATE GLASS.**—One hundred years ago, a plate glass mirror, fifty inches long by forty wide, cost, in England, \$300. In 1845, the price of such a mirror was reduced to fifty dollars; now the same can be bought for twenty dollars.

## Annealing of Steel.

We have noticed that, after the smith had finished his work and wished to leave the steel or iron forging in a condition of sufficient ductility for the lathe workman or filer to operate upon, he would carelessly heat the forging and either insert it into the ashes and coal-dust of the forge or heedlessly throw it upon the ground beside the anvil-block; consequently when the turner or filer begins his work he finds it full of small hard spots, some of them exceedingly minute, and technically called "pins," which spoil the cutting edges of his tools and destroy his files. Finding it impossible to proceed further in his manipulations he takes the unfinished article from the lathe or vise and sends it back to the forger to be re-annealed and returned to him. We have seen this process repeated two or three times on some kinds of work, when a little knowledge and care would remedy the whole thing.

In annealing, the steel should be heated slowly and carefully, as there is as much danger in over-heating as there is in forging, and the whole article must be thoroughly heated through and brought to no higher temperature than a "light red" heat. If the article is long, like a spindle, it must be turned frequently in the fire, to prevent its warping or becoming sprung by the unequal expansion upon its sides; and at the same time be careful to heat it equally the entire length. The forger ought always to have an iron box of dry powdered charcoal by his forge, and in this quickly insert the article that is to be annealed, and cover it close with the coal-dust, so that the air cannot come to it, and there let it remain until perfectly cold and no sign of warmth be perceptible. If this is carefully done, the lathe workman or the filer will have no cause of complaint about "pins" in the course of his operations.

Some forgers hurry the articles that they wish to anneal in powdered or air-slacked lime, cast-iron borings and sawdust, etc. These may answer a very good purpose, but they are in no way equal to the box of charcoal dust.

There is another method called "fire annealing" that is practised to some extent. It consists in heating the steel to a red hot and then holding it in a dark place until a faint glow of heat is seen upon it, and then quenching the heat that remains in it in water. This may answer when there is need of the forging to be wrought upon immediately, but it is an operation that we do not approve of, and is not as effectual as the operation that we have described with coal-dust. Let any one who works in steel try the various methods, and they will give a hearty approval to the box of charcoal dust. *American Artisan.*

Annealing or softening of iron is accomplished by a process of slow cooling; tempering or hardening is effected by a more or less rapid cooling, according to the degree of hardness which is desired in the article operated on. There are many substances besides iron and steel which become hard and brittle on being rapidly cooled; the most important of which, in the arts, is glass. Hence all glass manufacture, requiring strength or toughness, is subjected to a very slow process of cooling or annealing. The time required for this process in glass ware, depends upon the thickness or bulk of the articles operated upon. Hence, it is desirable, in that manufacture, that but one particular kind of ware should be placed in the annealing oven at the same time. One of the chief inconveniences of small and local glass establishments is attributable to this fact. Such establishments cannot conveniently put their whole force upon any one article of manufacture; but are compelled to divide up between two or three or more articles, at one and the same time.

Cast iron loses its brittleness in the annealing oven, and becomes almost as pliable as wrought iron. Cast iron nails, annealed, have of late come into quite extensive use for certain purposes.

Copper forms an exception to the general rule of metals in tempering or hardening. This metal is actually made softer and more flexible by being plunged into cool water when red hot, than by any other treatment to which it can be subjected. The gradual cooling of copper, in the same way that iron or steel is annealed or softened, hardens that metal. When it is desirable to render copper very soft, and the surface very clean, a small quantity of sulphuric acid, should be put into the water, which will have the effect of removing all the black scale, etc., from the surface.

## Scientific Miscellany.

## A New Furnace of Great Heating Power.

M. Deville, of Paris, has recently constructed a furnace of extraordinary power. The furnace consists of a flame of coal gas, inclosed in a chamber built of some non-conducting substance, into which a jet of pure oxygen is blown. In this way nothing but the material required for perfect combustion is admitted, thus obviating the objection to the use of common air which involves the necessity of introducing into the furnace a volume of inert nitrogen, much exceeding that of the oxygen consumed. When cold air (the cold blast) is used, a large portion of the heat generated is thus wasted in heating this large excess of nitrogen, to no purpose. This excess, in volume, is as one of oxygen to four of nitrogen—in weight, four of oxygen to fourteen of nitrogen. Hence it has been found highly advantageous to apply the waste heat of the furnace in raising the temperature of the air which feeds the flame, thus forming what is technically called the *hot blast*. The use of pure oxygen is not economical; but where a very high temperature is required, it is indispensable. In Deville's furnace, platinum, the most refractory of the elements, when placed upon a bed of lime and subjected to the flame, is easily melted. About one cubic foot of coal gas and one of oxygen will reduce one pound of this metal. The temperature generated in the Deville furnace has been estimated to be over 14,000 degrees Fahrenheit, or about five times higher than that required to melt cast iron.

This, it will be perceived, is an approximation to the idea which we advanced in our issue of the 12th ult., of the *desideratum* of some contrivance by which oxygen might be so cheaply generated as to render economical its application to metallurgical purposes. It appears that with the above furnace, one cubic foot of oxygen (the production of which cannot be a matter of very great cost) is made to reduce *one pound of platinum*. May we not have here an economical application of the idea suggested? If platinum could be readily reduced from its ores by heat, it would certainly seem as though an important point had already been gained. Platinum usually occurs in the form of a mineral alloy, with iron, gold, iridium, copper, etc., from which it is separated only in the wet way, and at great cost. When we have pure platinum, it may be readily drawn or hammered to any desired form, welded, etc.; but it is melted only at a very high heat—a heat quite unattainable in ordinary furnaces. If platinum can be separated from its natural alloys, by a simple furnace operation, it could then, by aid of Deville's furnace, be readily cast into crucibles, and introduced for numerous other useful purposes where it has not heretofore been employed, but where it would be of almost inestimable value in the arts.

**ARTIFICIAL SALTPETER.**—Mr. J. Bernhard, of Paris, has recently produced an artificial saltpeter by a process which at the same time yields, as by products, white lead and ammonia. He proposes to mix 157 parts of nitrate of lead with 39 parts of carbonate of ammonia, to obtain carbonate of lead and nitrate of ammonia. To the nitrate of ammonia thus obtained he adds 23 parts of lime, by which nitrate of lime is produced and ammoniacal vapors given off, which are collected in the usual way. The nitrate of lime remaining is mixed with 87 parts of sulphate of potash, by which an insoluble sulphate of lime is formed, and a soluble nitrate of potash, which, upon being concentrated, yields saltpeter in crystals.

A BEAUTIFUL VARNISH, limpid and clear, of a slightly brown color, suitable for carriages, etc., may be readily made by heating, under pressure, copal resin, with one-third of drying linseed oil.

**TURPENTINE FROM PETROLEUM.**—It is stated in a late issue of Dumas's *New York Journal of Applied Chemistry*, that a series of scientific experiments, recently instituted in London, have resulted in extracting turpentine from petroleum. The process is said to be safe and economical; and it is furthermore claimed that the turpentine can be obtained for about one-third the price heretofore paid for that article from North Carolina.

Naptha, one of the well known products of petroleum, has for several years been used in this country, for many purposes to which turpentine has heretofore been applied. A kind of petroleum was exhibited in this city, some two years ago, which was obtained from an oil spring in Colusa county, which, according to our present recollection, had very much the appearance and smell of turpentine. These facts would seem to attach much probability to the reported extraction of a genuine article of turpentine from petroleum. Such a discovery, if it be genuine, will very materially interfere with the turpentine business of this State.

**FOSSIL VINES.**—At a late meeting of the Imperial Horticultural Society in Paris, Dr. Thudichum of London, exhibited specimens of fossil vine leaves from a mine in Hesse Darmstadt. These, having been found lying under the basalt, were estimated by him to be above one hundred millions of years of age, and he considered that these facts and the peculiar character of the wild vines of the Rhine completely contradicted the almost universal belief that the vine had come to us from Asia. He believed that the vine was indigenous to all countries where it prospered now, and invited horticulturists to make experiments with the seeds of wild vines, particularly those of France, as they might thus obtain results of importance to horticulture.

**PHOTOGRAPHIC COLORS.**—A correspondent of the *French Repertoire de Photographie*, writing from South America, says: "Some time since, I took a positive portrait of my wife on glass. The weather was very fine, but on coming out of my dark-room I observed that the light appeared very yellow and somewhat obscured, and I then remembered that there was a total eclipse on that day. After developing and fixing my positive I found all the colors of my wife's dress faithfully portrayed on the film. The dress was of blue flowers on a black ground, the cap trimmed with blue and yellow ribbons, and all these colors were accurately reproduced, even the flesh tint of the face and hands were perfect. Unfortunately, all these colors disappeared after a lapse of ten minutes." The writer does not say whether any besides himself saw this portrait of his wife. This is, however, only one of many cases of evanescent coloring reported within a few years.

**RELATIVE PERSISTENCE OF DIFFERENT SOLAR RAYS.**—An experiment by Abbé Lathorde seems to show that waves in the sunbeam, of higher velocity, producing the perception of blue, make a stronger impression than waves of lower velocity. A rotating disk of metal having slits in its circumference so as to admit and intercept the solar beam, is placed in a dark chamber, between it and the observer is a ground glass screen to receive the beam. When the disk rotates slowly the separate appearances of the beam are distinguished. At higher velocities the image of white light is tinged with blue, green, rose, white, green, blue, in this order. After the second blue, the image is white at all higher velocities of rotation.

**A USEFUL HINT.**—It sometimes becomes desirable to test a piece of gilding. Gold leaf or plate may be known from a gold-colored alloy by the following test. Take a solution of common chloride of copper and apply a drop to the gilding; if it is gold, no effect will be discernable; if it is gold alloy or any other brass imitation, a brown stain will instantly be observable.

**THE FLORA** of the State of Pennsylvania is found to have undergone, of late, remarkable changes, plants that were formerly rare being now quite abundant. This effect is attributed to the spread of railways.

ALUMINUM and tin are now gilded and silvered so neatly that the layer cannot be disturbed by the hardest burnisher.

## WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING,  
January 25, 1887.

## CITY STOCKS.

During the week under review the transactions in city shares were mainly confined to California Steam Navigation Company and Spring Valley Water Company, the former selling within a range of 60@61, seller 10, and the latter steadily obtaining 62, with a slight improvement at the close.

We present in the annexed table a careful compilation of the operations of the Savings and Loan Societies for the half year ending in this month. It will be seen that they exhibit a steady increase in business, having added \$4,000,000 during the year 1886 to their deposits, and showing at present an aggregate of \$11,000,000:

## Semi-Annual Reports of the San Francisco Savings and Loan Societies.

NAMES.	Date of Report.	Deposits.	Loans.	Earnings.	Reserve Funds.	Expenses and Federal Tax.	Cash on Hand.
Hibernia Savings and Loan Society.....	January 21, 1887.	\$2,241,000.00	\$4,073,233.95	\$84,000.00	\$122,523.19	\$23,019.07	\$350,049.55
Savings and Loan Society.....	January 2, 1887.	2,292,335.45	2,335,472.43	138,686.73	87,104.54	\$8,128.90	150,884.55
French Savings and Loan Society.....	January 15, 1887.	1,822,654.13	1,801,819.95	116,300.67	44,105.75	7,945.00	222,734.43
San Francisco Savings Union.....	January 8, 1887.	1,002,998.22	922,233.47	56,435.25	74,795.44	9,631.91	90,901.08
Cal. Building, Loan and Savings Society.....	.....	.....	.....	.....	.....	.....	.....
Odd Fellows' Savings Bank.....	.....	.....	.....	.....	.....	.....	.....
Totals—January 1887.....	.....	\$10,358,888.40	\$10,195,914.80	\$64,469.35	\$325,918.92	\$48,718.88	\$892,762.11
Totals—July, 1886.....	.....	8,760,164.52	8,827,110.05	493,760.64	252,918.94	.....	630,939.27
Totals—January, 1886.....	.....	7,005,061.63	6,756,302.83	306,060.30	215,455.63	.....	574,603.10

\* Last annual report, September 10th, 1886. Assets at that date, \$300,000.  
† Went into operation December 1st, 1886, and has met with a fair degree of success.

Of the above institutions, the Hibernia disburses a dividend of 11  $\frac{3}{4}$  cent. per annum to its depositors out of the earnings during the past six months; Savings and Loan Society, 11; French Society, 12; and the Savings Union 10  $\frac{3}{4}$  cent. per annum to ordinary, and 12 to term depositors.

## MINING SHARE MARKET.

The stampede in mining stocks this week has created a marked sensation in all circles. It is often very difficult to account for the caprices of the mining share market, but during the past few days the decline has been of so serious a nature that there would seem to be some interpretation of the causes which have led it. So far as we can learn (and we have taken some pains to obtain reliable information), with, perhaps, one or two exceptions, leading mines show as much intrinsic wealth at present depths, and give as much promise for the future, as at any time within the past six months. With regard to the Yellow Jacket company, the case pending before the United States Supreme Court and its probable return to the lower courts for revision and re-trial, together with the almost impassable condition of the roads leading from the mine, rendering a dividend doubtful this month, and the rumored impoverishment of certain portions of the claim, are causes in themselves sufficient to create a slight panic. Added to these, a strong bear movement in other stocks was inaugurated early in the week, giving

great impetus to a general decline. Yesterday a decided rally took place, and a still further advancement may be anticipated.

HALE & NORCROSS—continues out of the market. At the close \$2,600 per foot is asked. This company's mine remains in a favorable condition. They have commenced operations on the new shaft.

SAVAGE—with the balance of the list, has declined very materially during the past week, selling at \$2,000@2,010, dropping to \$1,870 and \$1,700, seller 30, and closing at \$1,800. The ore extracted from this company's mine during the week ending January 19, amounted to 1,745 tons, showing an assay value of \$61,812; previous week, 1,016 tons, valued at \$35,923. In winze No. 1 from the 7th station water has become troublesome—so much so as to prevent working at that point for the present. In a drift made from this winze, at a depth of 50 feet, five feet of ore assaying \$50 per ton were found; the presence of a large body of water prevented further developments. In winze No. 3, on the south line, also from the 7th station, they have followed the ore—which is said to be of a good quality—to an incline depth of 25 feet. The south mine looks well, showing quite an improvement in the "breasts."

CROWN POINT—also sympathized with the general decline, opening at \$1,290, then selling at \$1,280@1,290, falling to \$1,100@1,000, and closing yesterday at \$1,040. During the week ending January 18th, 871 tons of ore were extracted; previous week, 980. In drifting west fifteen feet on the 400-foot level, it is said a fine body of ore, about three feet wide, was found, and in working south on the east drift, same level, to the distance of 30 feet, some metal was obtained. This vein is 630 feet from the west or main deposit of ore in the mine. The receipts of bullion to this date exceed the returns of last month.

YELLOW JACKET—exhibits the greatest decline on the list, a large number of shares changing hands, selling early in the week at \$1,235@1,240, rapidly declining to \$990, then to \$850 and \$720—a recession of \$520 in four days—and closing at \$760. From a report, embracing the two first weeks of the present month, we learn that 2,780 $\frac{1}{2}$  tons of ore were extracted from the mine, and that during the same period the bullion yield had been \$41,518. It is thought that the bullion product of the past week will amount to \$60,000. The ore lately found east of the shaft is 180 feet east from the deposit of ore on the fourth level, and is said to be 17 feet wide, and of good average quality. A new level, called the 230-foot level, is now being opened.

GOULD & CURRY—has been more active than for some time past, receding from \$575 to \$510, rallying to \$570, then falling to \$500, and the close selling at \$550. The tunnel from the D street shaft of this mine, at a rise of 25 feet, is said to be in good ore. All the chambers look well, and the dumps are full.

OPHIR—improved from \$158 to \$162.50, seller 30, receded to \$140, rallied to \$150, and closed yesterday at \$157.50. The north stope in the 9th station is said to look very promising. The 10th station drift is in 20 feet.

CHOLLAR-POTOSI—was dealt in to a considerable extent, advancing from \$222.50 to \$233, receding to \$215, and closing at \$212, seller 30. No material change in the mine. Forwarded to custom mills during the week ending January 19th, 896 tons of ore; previous week, 780 tons. . . . EMPIRE receded from \$185 to \$170, and at the close sold at \$172.50. . . . IMPERIAL from \$155 to \$145, closing at \$149. . . . BELCHER from \$155 to \$135. . . . CONFIDENCE from \$48 to \$40. . . . BULLION rose from \$31 to \$40, then sold at \$33. . . . OVERMAN varied little, selling at 25.75@26. . . . DANEY at \$5@4.50. An assessment of fifty cents per share was levied on this stock on the 22d instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$890,524.

WORDS FOR MINERS.—The Gold Hill Daily News, Nevada—a medium of good authority—saith thus:

The MINING AND SCIENTIFIC PRESS is a weekly journal, published in San Francisco, which is entitled to the subscription patronage of every practical miner in Nevada, and every person interested in Nevada or California mining operations. It is a well gotten up sixteen-page quarto; and its reading would tend vastly to the particular "posting" and general enlightenment of our working sort of folks. Subscribe for it. Five dollars a year; three dollars for six months. It should have an agency in Virginia and Gold Hill; but we see none advertised in its columns. Every new improvement in mining implements and operations are fully described by words and illustrated by wood cuts in this excellent publication. A specimen number can be seen at our office.

## SALES OF THE WEEK

BY THE S. F. STOCK &amp; EXCHANGE BOARD

## Monday, January 21.

4 shs Gould & Curry at 520 per foot.  
4 shs Gould & Curry at 510 per foot.

Amount of sales.....\$178,855 00

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

JOHN STEELE, an "oil prince," who succeeded in 1864 to \$150,000 in cash, and an income of \$2,000 per day, is now penniless. He has "fought the tiger." One hundred thousand dollars of his money is said to have gone into the pocket of Hon. John Morrissey.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACRETH, M. D., Attending Physician; W. G. W. HARFORD, Manager; H. ARNOLD, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-14

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Cal. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. 16v13-14

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of stuffed Birds, Shell, and Wax Flowers, besides Plants, Birds and Butterflies, for Indian's Toys, Shells, Sea-weeds, etc. 24v13-14

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 21v13-14

## To Owners of Mineral Cabinets.

A miner in Nevada has a lot of choice Crystals, which he desires to dispose of at reasonable rates to parties who may desire to complete their display of minerals. Address the office of the "Mining and Scientific Press." 19v13-14

## Judicious Resolutions.

Several of our most substantial and judiciously managed mining corporations have passed resolutions, since the approval of the new assessment law, requiring all notice of assessments and sales to be published in the MINING AND SCIENTIFIC PRESS, the only thorough (daily or weekly) mining journal on this coast. Our efforts to concentrate all mining advertisements in one paper, for the economical convenience of shareholders and assessment payers, are meeting with decided success. Those who believe in supporting the mining cause, should bear our paper in mind, and bring up this subject at the next trustee or shareholders' meeting.

San Francisco, April 7th, 1866.

## MINING SHAREHOLDERS' DIRECTORY

(Compiled for every issue, from advertisements in the MINING AND SCIENTIFIC PRESS and other San Francisco Journals.)

Comprising the Names of Companies, District or County of Location; Amount of Assessment; Date of Meeting; Day of Redemption; Sale; and Amount and Time of Payment of Dividends.

American and Foreign Patents.—Letters Patent for inventors can be secured in the United States and foreign countries through the Mining and Scientific Press Patent Agency. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of January 12th: The ore of the Constitution lode, now being opened by the Active company, is improving perceptibly as depth is attained. Now, at only ten feet in depth, native copper is plentiful, and the black sulphurets of copper and silver may be seen in little veins throughout the mass.

The last working of Morning Star ore was, we learn, a success every way... Capt. Swinerton, now in the Atlantic States, writes that all but six thousand dollars of the stock of the company that had the lease of the mine of the Buckeye No. 1, was taken, and they expected soon to send orders to commence operations.

Mr. Arnold tested the black ore from the Leviathan, by pulverizing and roasting. From eight ounces, he got one ounce of amalgam.

The Monitor Consolidated Mining Company, of this place, have now at their works a crusher and two pulverizers, from Whelpley & Storer's in Boston, and it is their intention, we understand, now that the proof is not wanting that our ores need roasting, and can be readily amalgamated after roasting, to purchase the right to erect one of these furnaces and put their mill in operation at an early day.

From same of 19th: Some very fine quartz was struck in the James Barrett Tunnel on Thursday of this week, in the shape of small feeders or spurs about an inch thick, bearing ore of the best character. This, together with the fact that the influx of water is becoming every day greater, is an encouraging sign. The present contract of fifty feet will be finished next week.

The contractor on the Mowyer tunnel has turned to the left for the purpose of cutting the lode which they have been for some time running along side of.

Three parties here, having in charge respectively the Mowyer, Tarshish and James Barrett tunnels, have each received word from Eastern correspondents that they would soon be placed in funds to commence operations on other claims in the vicinity.

## Amador County.

From the *Ledger* of January 19th: On Monday last, Mr. R. C. Downs disposed of two half shares—one-tenth each—in the Railroad mine, situated at Sutter Creek, for the sum of seven thousand dollars, cash. Since the sale, the same interests could not be purchased for less than six thousand dollars each, and would be cheap at that.

Letter to same, from Volcano, January 17th: Mining does not furnish much of a topic to write about at this time. The weather has been too much broken to allow the placer miner to do much, and the ground is so soft that the quartz men cannot transport rock to advantage.

## Calaveras County.

From the *Chronicle* of January 19th: Mr. George Wilson has lately discovered a very handsome quartz lode, on the foot of Ragtown Hill, which seems to be well defined, and shows about two feet thick on top. It has a good deal of iron sulphurets, and shows some fine gold to the naked eye.... Saturday, Messrs. Gratacap, Gamble & Co. cleaned up, at Hepburn & Co.'s new mill, at Railroad, near one thousand dollars from fifty tons of quartz taken from their Spruce Gulch lead. This was the first quartz crushed in the mill, and its yield speaks well both for the mill and mine.

Correspondence of the San Andreas Register of January 19th: The owners of the Whisky Slide claim have suspended work for some time in their mine, but are shortly going to sink still further on their lode. There is no necessity to cut across to determine its thickness, as it is now upwards of twenty feet wide. A number of assays have been taken, and the results, even with the inferior rock, in every instance has proved most flattering.

Letter from Murphy's to the Columbia Citizen, dated January 13th: The quartz mines in this vicinity are proving as good as the most sanguine could expect.

Dan McCay and Co.'s lode is looking finely; they are down about 70 feet and at that depth the lead is two and a half feet wide and prospects finely. The Collateral, owned by Morse, Green & Co., are down some fifteen feet, the lead is two feet wide, and well sprinkled with the precious metal. Four pounds of rock, crushed in a hand mortar, yielded \$3.25. It is quite certain they have one of the best lodes in the county. Woods & Co., on Indian Creek, are still getting out some fine rock.

## El Dorado County.

From the Placerville Courier of Jan 19th: Leon and others, owning the North American lead, northeast of town, are sinking a shaft, and are now down about fifteen feet. The mixture of porphyry, quartz and dirt which they have taken out has yielded a rich prospect to every pan, from the surface down, and rock has been found showing free gold in liberal quantities. They contemplate erecting an astra.

Three of the owners of the claim on the great porphyry lead, have sold out their interests therein for twelve hundred dollars to parties from Gold Hill.

The Blue Lead Cement Company at Smith's Flat, cleaned up last week, after a run of two weeks, \$1,000.

The Manning quartz property has, we understand, passed into the hands of an Eastern company. The shaft is sunk to a depth of 130 feet, showing a wide ledge with a free sprinkling of gold dispersed throughout the quartz.

Mitchell, Emery & Towne of San Francisco, have purchased the old Tucker claim on Little Spanish Hill. They are using sixty inches of water, with a pressure of two hundred and ten feet, running off an immense quantity of surface dirt, and have already made a fine opening. They have ten to fifteen feet of pay gravel, with an area of fifteen acres, which they intend to work. Two other companies are erecting hydraulic apparatus on Big Spanish Hill.

Kelsey correspondent of the Democrat, says: "Look out for some tall strikes in this township the coming spring. The rich strike in the Woodside & Shanklin claim has excited our usually quiet people, and started them to prospecting. Not a few of our old, quiet residents have 'quartz on the brain.' I am not sorry, for I believe the result will be the discovery and development of a number of claims in our neighborhood. In early days this township was noted for its rich placer diggings, and it seems to me it must follow as a natural consequence that rich quartz veins must be in the vicinity of rich surface diggings. We entertain this belief and are prospecting on the strength of it. A number of claims have been located and work done on most of them—sufficient to hold them, but the rock has not been tested.

Letter from Latrobe to the Amador Ledger of Jan. 19th: The new diggings lately struck near this place caused considerable excitement in the neighborhood, but everything is now quiet, owing to the fact that the parties who first discovered the diggings, near Drigan's had some misunderstanding about the division of the gold, but that has been arranged and they were to commence operations again to-day. In another claim, discovered by Mr. G. Taylor, they have been at work on a ditch, and expect to be taking out the ore in a few days. They think they can make from \$8 to \$10 per day to the haul. In both of these claims the gold is found in decomposed quartz.

## Kern County.

From the Havilah Courier of January 12th: The Joe Walker mine is in the Quito Mining district, about ten miles southeast of Havilah. A few days after its location, in March, 1866, it was sold for \$2,000. The purchasers, after sinking fourteen feet upon it, disposed of one-third of it to E. B. Burke for twelve thousand five hundred dollars. From that time to this the work upon the mine has been prosecuted with energy and vigor, and at the present time the main shaft is down to the depth of one hundred and twenty feet. The company have a 20-stamp mill.

The amount of quartz crushed to date has been about twelve hundred tons, which has yielded the sum of forty-three thousand dollars. The average yield of the rock is thirty-five dollars per ton—the lowest yield being twenty-five dollars and the highest fifty dollars per ton. The quartz taken from the vein is all worked in the mill, and no selection or separation of rock is ever made. At the present time there is a sufficient quantity of pay rock in sight to keep the company at work for a year to come.

Several new lodes have been discovered in the Quito district which prospect well, and may in time prove as rich as the Joe Walker.

## Nevada County.

From the Gazette of January 19th: The Eagle company of Hartford are now down 250 feet on the incline of the California ledge, and have drifted fifty feet north and one hundred and sixty feet south. All the rock taken out in the drifts will pay, and some of it is very rich. The new mill is now ready for work, with the exception of five Bradford's shaking tables, which will be finished in a few days. The mill has ten stamps of eight hundred pounds each. The work on the Grizzly ledge, in Eureka township, belonging to the same company, is being carried on night and day. They have

a four-foot ledge, and the rock looks well. They made one crushing in the mill, the rock yielding some eighteen dollars a ton.

From the Transcript of January 19th: The Banner mine is now thoroughly opened, and the workmen are taking out rock at the rate of twenty-five tons per day. The large mill at the mine is kept in constant operation, and, besides, Stiles' mill is also constantly supplied with rock. The Stiles mill is now being repaired, and we understand that the French mill will be employed on the quartz.

The Grass Valley National of January 18th says: A friend of ours was on Woodpecker Ravine, on Wednesday, looking for nuggets, and was so fortunate as to find one weighing about thirty dollars.

EXCELSIOR.—From the Nevada Gazette of January 21st: We were shown, yesterday, some very rich specimens from the ledge of the Golden Eagle company, at Meadow Lake. The ledge, at the place they are now working, is four feet in width, and the part containing the rich rock shown us is two feet in width. There are no sulphurets in the rock, the gold being free and evenly disseminated through the rock. The company have built a new 5-stamp mill since the winter commenced, the machinery having been hauled in on sleds over the snow. They have seventy-five tons of rock out, and will commence crushing on Monday next.

The Transcript of 22d says: Marshal Jeffrey, of Meadow Lake, arrived in this city on Sunday morning. He informs us the snow is about ten feet deep on a level, and the traveling, except on snow shoes, is rough. Business at Meadow Lake is dull and money is scarce, but the mines are looking first rate.

The Mohawk and Montreal company are getting out quartz all the time. The machinery for the mill is out on the road, and they are making every effort to get it in.

The U. S. Grant is running day and night, and the rock is paying from forty to sixty dollars per ton.

The Golden Eagle company have out a large amount of rock which it is estimated will yield \$150 to the ton. They have just completed a 5-stamp mill which they expect to start up to-day.

The California company are working a double shift, and are sinking on the ledge for the purpose of getting it thoroughly opened.

Thirty pounds of Golden Eagle rock yielded \$10.30 when pounded in a mortar. The reduction works are expected to be completed in three weeks. This mill is built by a joint stock company of citizens, and is said to be the finest mill in the district. It is to be a custom mill, and will afford a good opportunity for prospectors.

## Placer County.

From the Herald of January 19th: Capt. Mallet is now busily engaged in erecting his mill on the Badger Ravine Cement Claim. Some of the cement in this claim prospects as high as 60 cents to the pan. A tunnel has been run into the claim about 400 feet.

We learn that the mill on the St. Lawrence ledge, near Ophir, was completed within a very few days of the time set by Mr. Roberts, the superintendent, in spite of certain unforeseen delays. It was started up on the 11th inst., and worked to a charm. The battery has six stamps of 650 pounds each. A "hurdy-gurdy" wheel, eight feet in diameter, driven by water brought for a distance of some 850 feet in iron pipe, is the motor. The cams are placed upon the wheel shaft, and there is but a single one to each stamp. The battery will crush ten tons per day. A conveniently arranged and substantial building protects the works. The unusually wet season, however, will oblige the company to erect pumping apparatus or to discontinue operations for a time. The main shaft, now down some 90 feet, has been partially filled by surface water, rendering it necessary to stop for the present, so far as mining is concerned.

## Plumas County.

From the National of January 12th: We are indebted to a correspondent from Taylorville for the following items:

Wm. Vaubuskirk has bought one-half of the Buchanan ledge in Indian Valley, and intends to erect a mill upon it.

Work will be commenced upon the Premin again in a few days.

From the Quincy Union of January 19th: We learn that the Spanish Rauch water ditch was badly damaged by the recent storm. At numerous places, where the ditch crossed ravines, it is nearly all washed away. It is very doubtful whether it will be repaired again, as it would cost not less than \$2,000 to put it in good condition. The mines on Shores' and Badger hill are supplied with water from this ditch, and, as a matter of course, they will be valueless unless the ditch is repaired.

The Cosmopolitan Co., at Genesee Valley,

resumed work upon their tunnel on Monday, and intend to keep at it until they strike something.

L. Sanders & Co. are at work in Mulroony's old claims on Soda Bar, and are making big wages.

## Sacramento County.

The Folsom Telegraph of January 19th says: The miners are doing well in and about this vicinity. We hear of rich strikes in all directions.

## Shasta County.

From the Courier of January 12th: The miners about Lower Springs are doing well this winter. So far the season has been quite favorable for working such diggings. Nuggets of considerable size are frequently found, and most of the gulches and flats pay very regularly. Last week N. C. Sweetzer found an ounce slug, and another miner working just above him found a piece weighing thirteen dollars.

The Whisky Creek flume is to be rebuilt on an improved plan. It will in future be safe against floods.

Last week, in speaking of an assay of rock from the Pacific claim, we said the result was \$228 in gold. It should have read \$828.73.

E. A. Kelton will soon commence work on the second extension of the Red Warrior claim.

From same of 19th: In South Fork district, the Chicago tunnel is in a distance of 200 feet, and the shaft down over 60 feet. Work is continued on this claim day and night, and some fine looking rock is being taken from the shaft for shipment. The Confidence and the Montgomery have each shafts sunk upon their lodes to the depth of 10 feet. The Ohio shaft is down 25 feet, and the Crystal has one sunk to the depth of 40 feet. The Pacific tunnel is in 140 feet, and taps the lode 100 feet below the surface. The lode is about 13 inches wide, and prospects very rich. A tunnel has been run in the Dayton 25 feet, and one of the Crystal extensions has a shaft down 14 feet. A little work has been done on the Red Warrior, but the storm drove the workmen out, and operations have been suspended until more settled weather.

Capt. Kidd prepared and set off a blast in his claim, near Centerville, a short time since, which did good execution. The bank of the claim is over twenty feet deep. A small drift was run back from the face of the bank about twenty feet, a number of kegs of powder deposited therein, and the drift closely packed and tamped. When all was ready the Captain set fire to the fuse, and in a few minutes thereafter an explosion took place which fairly pulverized the bank for a considerable space in every direction. Four days' sluicing were required to run the gravel thus loosened through a large sized flume.

## Sierra County.

La Porte correspondence of the Downieville Messenger of Jan. 19th, says: Times are brisk here now for the miners, as everybody is at work. Water is running in every ditch, pipe and hose, and we see, even now, buckets of amalgam going into Conly's for assay and safe keeping. Mr. Kleckner, of Port Wine, told me yesterday that he had seen \$10,000 for circulation in that little town.

A correspondent of the Alta, writing from Goodyear's Bar, has the following: The Blue Gravel range has been tapped in a new place by the Magnolia Company, whose ground has been located upon the dividing ridge between the north and middle branches of the Yuba river. The tunnel of the company is distant about two miles from this place in a southerly direction. It is now in 1,200 feet, and the prospects good.

## Siskiyou County.

From the Yreka Union of Jan. 12th: Mr. Washington Bailey, who resides on Lower Soda Creek, Shasta county, informs us that the miners in that vicinity have had better success this season than for several years past.

## Tuolumne County.

From the Columbia Citizen of Jan. 19th: Mining operations have once again been started. Haines & Co., after blasting through huge limestone bowlders, have reached with their flume the rich diggings that lay beneath Main street. They will have to run their flume many hundred feet before they reach their own diggings. Mauchester, Keith & Co. are busy hydraulic with two pipes, the lots at the foot of Main and Washington streets, where stood, a few months ago, a large block of brick buildings, which were sold to this enterprising company, who pulled them down and disposed of the brick.

Mr. James Farrell found a piece of pure gold weighing ten ounces, while moving a pile of tailings on Main Gulch, in that city, one day last week.

## Yuba County.

From the *Marvsville Appeal* of Jan. 20th: We continue to hear good reports from the Bateman quartz claim, located in the Indian district. Mr. Bateman caused twelve tons to be crushed last week at Templar No. 2's mill, which yielded at the rate of \$20 per ton from the plates and battery—the Chile mill not being cleaned up. As the Chile mill yielded about equally with the plates and battery at a former crushing, it is believed this rock paid \$30 or over to the ton. This crushing, too, did not include the extra rich rock. The best is sorted out and sacked.

From the *North Californian* of Jan. 16th: The Buckeye mill, which has been stopped for repairs several days, commenced operations again to-day.

Same of 21st: The Babbelaim at Timbuc-too, last week, as the result of a twenty days' run, cleaned up \$8,000. Their claim is finely opened and its owners expect to take out \$10,000 a month hereafter.

## ARIZONA.

From the *La Paz Gazette* of Jan. 3d: From Wickenburg we hear favorable reports of the operation of the Vulture Company, who keep their small mill running steadily and successfully.

The smelting furnaces put up on the Mineral Hill copper mines, Williams Fork, by Messrs. Knowles & Coffin, have gone into operation, and are reported to be a great success.

The *Los Angeles News* says: A new mining district north of the Tehuero and East Soledad district has been formed. Gold bearing quartz of great richness has been discovered in the new district. The leads average from four to eight feet in width. Four large arastras will be in operation in a few days. A water wheel, sixty feet in diameter, has been erected for the purpose of driving a 20-stamp mill. The leads discovered are so situated that a tunnel of six hundred feet on the lead will be one thousand feet from the surface.

## BRITISH COLUMBIA.

A private letter from the Big Bend mines, of late date, addressed to Dr. Shiel, has favorable news in relation to the mines. Messrs. Cain & Co., and Mountain & Co., on French creek, are reported to have struck a big thing. The Robinson tunnel, also on French creek, is working well. These are all that are being worked to advantage.

## IDAHO.

A letter from Greenville to the *Montana Post* of Dec. 29th, says: We believe this will be the best mining camp in the Rocky Mountains next season. There is a large number of from twelve to sixteen dollar diggings, with some that will pay better. New diggings are being struck every week, and among the latest may be mentioned Montana Bar and Knapps' Creek, with good paying prospects. We think it is safe to say that this camp will average fifteen dollars per day to the man. There are about five hundred men wintering in the basin, and more are coming all the time. All are busy; some rocking, some prospecting, but the most are engaged in building on speculation on their town lots.

From the *Owyhee Avalanche* of Jan. 12th: The Shoenbar mill, has been running steadily for three weeks, with a fair prospect of continuing profitably without further interruption. Fifty tons of Silver Cord rock was first worked—the amalgamating being done by Mr. Shoenbar with satisfactory results. Early this week the mill started on Whisky Gulch ore. We are informed by Mr. Agnew that he has a contract by which he is to receive ten tons daily from this mine. This will ensure the steady running of the mill.

Letter to the *Alt* from Rocky Bar, Alturas county, dated Jan. 5th, says: But two quartz mills have run this winter—the Waddingham mill, in charge of Jno. Green, and the Idaho mill, by the company resident—both with great success. A large lot of machinery has been sent into the Yuba district, and more is on the way. We learn that Colonel John O'Neal, of Stockton, is having a 20-stamp mill ready to bring in the spring. His interest in the North Star, and in the Sophia Tracy, will give him all it can do. These ledges are five and eight feet wide, and assay \$300 per ton. Fifty dollars is here considered good paying rock.

At Red Warrior, one and one-half miles distant, scarcely anything has been done this winter. The Victor Company has a sheriff in charge of their mill, until their quarrel with their superintendent is arranged. The New York and Idaho mill has its superintendent at New York city, stirring up the company, or getting stirred up, I don't know which. The Wide West mill, with one of the best ledges in the Territory, is also idle. The tunnel of Messrs. Wulff & Biven will not be worked again until April.

## MONTANA.

From the *Post* of Dec. 29th: We learn from the *Herald* that Judge Turnley has taken from the Park lode nearly 1,000 tons of ore, which has yielded about \$30 per ton. The cost of extracting the same was only \$3 per ton.

A merchant of this city, who has just returned from a flying visit to Highland, informs us that Mr. Mansfield took from his claim below the town, during the previous week, the very convenient amount of \$6,000. Six laborers are engaged in drifting and appear to have started on a road that is paved with gold. A quartz ledge of wonderful richness has been discovered at the head of the aniferous gulch.

Mr. Geo. Atkin, who is acting in behalf of the Brooklyn Gold Mining Company, has purchased a 12-stamp mill of Mr. Hendrie. On the 24th inst., the machinery was transported to the "George Atkin Lode," which was recently discovered near Meadow Creek. A few cabins have been constructed, and the workmen have given the place the name of Atkinville. Over 100 tons of ore have been extracted, and unless something unforeseen occurs, golden results may be looked for before the "ices of March." The Wyck-off process will be thoroughly tested.

One of the largest clean-ups which has ever been made in this Territory, (or, we may add, in any other, from the same amount of rock,) was made last Monday, in Judge Turnley's 10-stamp mill, crushing ore from the Whitlatch Union lode. The mill crushed ninety tons of rock, and the amount of bullion will be close on to \$12,000.

## NEVADA.

## Humboldt.

From the *Register* of Jan. 12th: Mr. Fall showed us, yesterday, 420 ounces of crude bullion from the Pioneer mill, the result of three and a half tons unsorted rock from the Essex. This rock was milled as taken out—all between casings—and the bullion is judged, by those experienced in the business, to be worth a dollar an ounce in silver, and is known to contain a small amount of gold.

From same of December 29th: Mr. White, one of the discoverers of the Golconda ledge, informs us that the ledge is  $3\frac{1}{2}$  feet in width, and very soft—a dark-green looking ore, which in pulp looks black as ink. It is so soft that two men take out five tons daily. Holt, of the Winnemucca mill, agreed to haul and work a ton of the rock. He did so, and paid them \$80, after deducting for hauling and milling. But a small opening has been made—an open cut of about fifteen feet. From this has been taken what is estimated at forty-five tons first class. The whole body of the ledge is worked, after separating into the two classes. Holt has been running his mill on it for some weeks. The first class yields \$117 in bullion 995.5 fine. It is easy to crush, and is worked by the simplest chemicals. A contract has been let for an incline of fifty feet on the ledge, taking out four by five feet of the rock. This ledge is in the second East range, about twelve miles in a direction slightly south of east from Holt's mill, though by wagon it is twenty-three miles.

Teams are hauling continually to Holt's mill, and rock could be taken out, apparently, to employ all the mills in the county. The Golconda ledge crops plainly through a distance of about a mile and a half. Mining, hauling and working cost \$12.50 the ton.

## Reese River.

From the *Reveille* of Jan. 11th: We paid a visit, the other day, to the Manhattan mill. Although its arrangements are extremely faulty, it is managed well. The Gardiner crusher is a decided improvement. It dispenses with the labor of four men.

From same of 12th: The North Star, one of the mines of the Manhattan Company, is opened by a vertical shaft, which has reached the depth of 325 feet. The first level was run at the depth of 180 feet. One hundred feet below this, a level is now being run, and has been pushed in to the eastward 145 feet, and will be made to follow the vein to its eastern boundary. Yesterday morning the workmen penetrated a chimney of beautiful ore, which had been cut in the upper level. A handsome specimen of dark ruby silver from this chimney will go to the Paris Exposition. The rock is at present easily worked.

Same of 14th says business is overdone at Belmont, and supplies as cheap as at Anstin.

From same of January 15th: Yesterday afternoon Colonel Buel returned from Silver Bend, with upwards of 7,000 ounces of bullion from his mill at Belmont. A much larger amount was looked for, but it appears that a heavy fall of snow had blocked up the roads, and prevented the hauling of ore and wood.

## Washoe.

[In the Stock Circular, in another portion

of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Jan. 16th: The new incline of the Plato Company, Gold Hill, is now down about ninety-five feet, and is being pushed rapidly forward, day and night, by three shifts of men. It is being run by contract at \$7.50 per foot, and is to be 150 feet deep. It is being well timbered, and has a double track the whole length.

From same of 18th: The Bonner shaft of the Gould & Curry Company is now about 750 feet deep, the sinking of it being recommenced a week ago last Monday, after a cessation of nearly a year. Three shifts of men—six men to a shift—are pushing forward the work with great energy. The hoisting and pumping machinery is of sufficient capacity to allow of sinking to the depth of 1,300 feet or more. The fifth level of the mine is now being opened, and the future prospects of the company are very flattering. The shaft of the Imperial and Empire companies has now attained the depth of 750 feet. The present machinery will carry it to the depth of nearly or quite 1,000 feet. The Curtis shaft of the Savage Company is now about 450 feet deep, sinking being recommenced last Monday, after having been discontinued for a year. The hoisting and pumping machinery used is the most powerful for the purpose in the State, the largest engine being a beam engine of 250-horse power. It works in the most perfect manner. The Chollar-Potosi new shaft is 700 feet deep. The shaft of the Bullion Company is also 700 feet. The Ophir-Mexican shaft is about 620 feet. A tenth level is being opened, sixty feet below the ninth, or lowest.

Same of 19th: The suit of Thomas Farrell vs. the Savage Mining Company, which was commenced two or three weeks ago, claiming as a front ledge 600 feet of the rich ground now being worked at the lower level of the Savage claim, running north from the north line of the Hale & Norcross, and \$500,000 damages, came to an abrupt close yesterday in the District Court, the suit being dismissed on motion of plaintiff, at his own costs.

From the *Virginia Union* of Jan. 14th: A few weeks ago, Fred, Black and Mr. Spittle, of this city, discovered a quartz ledge eight miles north of here, on which they sunk a shaft about eight feet deep, at which depth they obtained rock that contained native silver plainly visible to the naked eye. An assay of the ore yielded \$76 in silver and \$25 in gold per ton.

Same of 11th: Yesterday morning about five o'clock, a large cave occurred in the north end of the old works of the Yellow Jacket mine, next to the Burke and Hamilton ground. It was sixty feet long and about forty wide. The ground had been worked to within some twenty-five feet of the surface, and in ten places the timbers can be seen below, through crevices made by the cave. The men on the night shift had gone off but a few minutes before, and the day shift had not gone to work, so, fortunately, no one was hurt. Part of the caved ground was worked by outside parties on contract, and the other part by the company.

From the *Gold Hill News* of Jan. 16th: The Sierra Nevada Co. are engaged in taking out the machinery of their old works and removing them to a point some 300 or 400 feet east, where a shaft has been sunk to a depth of 518 feet, from the bottom of which a drift has been run east a distance of 150 feet. The large engine is in position, and within six weeks will be ready to start up.

## Black Rock.

The *Chico Courier* of a recent date says in regard to this district: Ton after ton of the rock has been worked by mill process, and the silver bricks produced are the best test of the richness of the ore. The ore has yielded from \$100 to \$700 per ton, when correctly worked by those who understand the process. The Chico company has not been idle, and some of their tests, on account of their high authority, are probably the best and most correct of any that have been made. We are informed that specimens sent to Mr. Martin, on his first trip to Black Rock, were forwarded to General Bidwell, at Washington, who is a member of the Chico Mining company, and were by him taken to Europe and fully tested by the best metallurgists and mineralogists, and those tests proved the ore rich beyond their most extravagant ideas; and what is of more value, that the ore can be worked by mill process cheaper than ordinary quartz. The company is to be organized on a more permanent basis, and will open the spring campaign with a 24-stamp mill, with an experienced superintendent, who has proven himself competent to work the ore successfully. The mill will be located in the High

Rock or Chico district. We are informed that the Mineralogical Institute at Freiberg, Germany, has made propositions through General Bidwell for an interest in the company.

From the *Susanville Sage Brush*: We have just been shown by Mr. John S. Ward, a linton of pure silver and gold, weighing one-fourth of an ounce, which he took from six ounces of Snow Storm ore by amalgamation. He informs us that he used a new agent in amalgamating the rock, which, by the way, is one of the most common substances in the country. The figures show that calling the linton all silver (and there is evidently a large proportion of it gold), the rock to work \$1,200 per ton. Mr. Ward worked this rock by common amalgamating process.

## WASHINGTON.

From the *Walla Walla Statesman* of the 11th January: Within the last week information has reached here from reliable sources, that a party of Frenchmen have discovered rich diggings on a creek, distant about forty miles from Colville. This creek is a tributary of the Pen d'Oreille, is estimated to be thirty miles long, and will afford claims for a large number of miners. At last accounts, working with snow on ground, and with no other convenience than pans, they were taking out from fifteen to twenty dollars to the hand. The parties who made the discovery had come into Colville for supplies, and paid for the same in dust taken from the new mines. The excitement in Colville Valley in relation to these new mines was intense, and large numbers of persons had gone out to secure claims. As soon as the news reached Walla Walla, a party was made up and forthwith started for the mines.

## The California Wool Crop for 1866.

The annual Wool Circular of Messrs. McLennan, Whelan & Grisar, of this city, contains some very interesting statistics and facts with regard to the wool growing interest of this State. We compile as follows:

The total receipts at this city for the year 1866 was 8,377,287 pounds, including 443,200 pounds from Oregon, worth about one and a half million of dollars. The amount exported has been 6,549,931 for 1865, against 4,662,120 for 1866. The home consumption having been 3,189,500 in 1866, against 2,350,000 for 1865.

One of the most encouraging facts connected with the business, is the decided improvement in the quality of this year's crop over any preceding one. The wool was healthy, well put up, and hotter conditioned than ever before, and, according to a "Boston Circular," compared favorably with the western wool. The wools were divided for export into six grades, which in 1865, read as follows: 1st grade,  $1\frac{1}{4}$  of the total amount of import; 2d do. 15%; 3d do. 48%; 4th do. 13; 5th do. 16%; 6th do. 4%. The reading for 1866 is 4, 25, 50, 12, 8, 1=100.

The Oregon wool has been mostly taken up to supply the local manufactories. The prospects for the next spring clip opens very favorably, the heavy rains being an advantage both in the production of feed and for cleansing the wool upon sheep-back.

It remains with the sheep growers themselves to maintain the good name already acquired for our California wools, and for still further advancing its reputation. Additional care may be advantageously employed.

The statistics of the wool, hide and tallow business are given for the past ten years. The warehouse of Messrs. McLennan, Whelan & Grisar, having become the Wool Exchange of California, where most of the sales are effected, that circumstance, in connection with the increase of their business of storing and grading wools, has rendered it necessary that they should add two additional stores to their already extensive buildings, which fact, of itself, speaks well for the prosperity in this important and growing branch of industry.

ONE MILLION and a half of dollars, in silver, was taken annually from the Valenciana mine, in Gnanajuato, Mexico, from 1768 to 1788. For twenty years afterward the yield was over a million per year.

## Mining and Scientific Press.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office. SAN FRANCISCO, Jan 11th, 1866.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

Mr. S. D. Whitaker, is our authorized Traveling Agent and Solicitor from this date. Jan. 1, 1867.

## San Francisco:

Saturday Morning, Jan. 26, 1867.

## NOTICES TO CORRESPONDENTS.

H. S.—ANTIOCH.—The history of coke dates as far back as the middle of the seventeenth century, as is evidenced by the following quotation: "There is a sort of fewel made by charking or calcining Newcastle coals, which burns without smook, without fouling the furniture, and altogether as sweet, and is much more lasting and profitable than wood or charcoal; it kindles suddenly, and is useful either for chambers, roasting of meat, drying of malt or hops, woolcombing, distilling, preserving, or any such like employment. His Highness the Lord Protector, with the advice of his Council, have encouraged and authorized the making thereof in order to the preservation of the woods of the nation. If any shall desire to make tryal for any of the use aforesaid, which will cost little or nothing, the experiment, they may repair to London at Northumberland Wharf, near Chearing Cross; and according to the satisfaction they receive therein, they may be supplied from time to time with what quantity they shall have occasion to use. Those that have made tryal of it, finde it very profitable to all those uses abovementioned. It is also very useful for the tobacco pipe burners."—*Public Intelligence*, No. 139, from Monday, August 16, to Monday, August 23, 1658, p. 764. This advertisement appears also in the succeeding number for August 30, but apparently not in any of the previous numbers. The first improvement in the manufacture of coke was made towards the end of the ensuing century by Earl Dundonald, father of the hero of the Quiberon Bay, but otherwise better known as Lord Cochrane, in common with the struggle for independence by the South American States. Earl Dundonald foreshadowed many recent improvements, although his first attempts were commercially failures. In fact he greatly impaired his estate in consequence of the money which he lost in the undertaking.

S. P.—COPPEROPOLIS.—The first steam engine erected in England was put up at the *Huel*, or as it is now commonly spelled and pronounced, *Wheal Vor*, a celebrated tin mine in the parish of Breage, which was at work from 1710 to 1714. Whether this engine was one of Savary's or Newcomen's, is doubtful. As, however, Newcomen's engine was not much known before 1712, and subsequently came into general use in Cornish mines, and after the introduction of Watts' improved engines, about 1770, it was known as the *old atmospheric engine*; it is probable that Savary's was the one employed.

J. Y.—AUBURN.—Gunpowder was first employed in England for mining purposes, at the Ecton copper mine in Staffordshire, about the year 1670. It had been used previously in Germany for the like purpose.

THE NATIONAL MINING LAW.—A Washington telegram dated January 24th, informs us that Commissioner Wilson, of the General Land Office, has at last issued instructions to the Registers, Receivers and Surveyors-General to acquaint themselves with the local mining customs and usages of the respective districts, with a view to the carrying into effect the law in regard to mining claims, which was passed at the last session.

## NATIVE LEAD.

In our issue of two weeks since, page 19, in noticing the occurrence of native lead associated with gold, in Australia, we stated that we were not aware of any similar occurrence on this coast. During the past week, however, our attention has been called to page 38 in Kustel's "Nevada and California Processes of Gold and Silver Extraction," where the occurrence of this mineral in the Comstock lode is fully noticed, as will be seen below. Native lead is a mineral of very rare occurrence, and is mentioned by Dana as being found "in thin plates and small globules." The only localities of such occurrence mentioned by him, are "in globules in galena at Alston Moor; in lava, in Madeira, Rathke; at the mines near Carthage, in Spain; in carboniferous limestone near Bristol, and at Kenman, in Ireland; \* \* and in red oxide of lead, near a basaltic dyke in Ireland."

Under certain artificial circumstances, lead crystallizes in regular octahedrons. In this form it is sometimes found in the masonry of smelting furnaces, or in the hearth mass of cupelling furnaces. In nature, however, it is only found, as above, in small grains or thin laminae. It was not found until recently in Australia, as noticed in the Press two weeks since, combined with gold.

In 1861 native lead was found in the silver ore of the Comstock lode (Ophir), Nevada, alloyed with silver, gold and copper, in very variable proportions. It consists of silver 60 to 85; lead, 8 to 30; gold, 1.9; copper 1 to 5 per cent. H=2.7—3. Gr.=10.6—11.3. [See California and Nevada Processes of Gold and Silver Extraction, page 38.] Some specimens were sent to the Mining Academy in Freiberg, and examined by that most distinguished mineralogist, Professor Breithaupt, who gives a description of this mineral in his "Mineralogical Studies," (Berg und Huettenmaennische, Zeitung, May, 1866, page 169, under the name of *Kustelite*, as follows:

"The specimens have the size of very small beans, of a silver-white color, a little darker than native silver; (on a fresh surface) the fracture is hackly. It is perfectly malleable. Impressions with a knife are easier made than on native silver. H=2.25—2.75. Gr. variable,=11.3—13.1. According to Mr. Kustel, who discovered and examined this mineral, it chiefly consists of silver with lead and gold. Prof. Richter analyzed one of the specimens and confirmed the above composition. In Siberia, similar grains of native lead were found very rarely in the gold washings; but there was partially a doubt as to their natural origin. The appearance of the *Kustelite*, however, seems to speak for the possibility of a natural alloy of silver and gold with lead."

Professor Breithaupt was under the impression that the *Kustelite* was found in the "Ophir gold washings." In such a case, a suspicion might be entertained that a lump of an artificial compound from an old smelting furnace, or from some other source, might have been lost, and in time, amongst the gravel, parted in small fragments; but as this mineral occurs in the Comstock lode, there cannot be the slightest doubt that the combination of lead, silver and gold has been produced by natural agents.

ASSAYERS' MATERIALS AND CHEMISTS' WARE.—A fine assortment of everything in the way of assayers' materials, miscellaneous chemicals, chemical ware and photographic stock, may always be found at the establishment of John Taylor & Co., 512 and 514 Washington street. Messrs. Taylor & Co. having long been engaged in this business, and having extensive European correspondence, are well prepared to meet the varied and constantly increasing wants connected with the development of the mineral wealth of this coast.

COMMUNICATIONS RECEIVED.—"Earthquake Phenomena," by D. V.; "The Value of Pans in Working Auriferous Quartz," by Quartz Prospector.

## ORANMER'S MACHINE GUN.

T. J. Craumer's machine gun or battery is now on exhibition in this city. It is said to be capable of delivering 300 musket balls per minute, with all the force and accuracy that an ordinary musket is capable of. All that is necessary, after taking aim, is to turn a crank, and keep on turning placing a cap on a revolving table for each discharge. A public exhibition of the battery was made on Thursday afternoon, at Liddle's gunsmith shop on Washington street, on which occasion ninety shots were discharged in fifteen seconds, which, at a distance of twenty-seven yards, perforated an inch board—the shots from each barrel striking in nearly the same spot every time. The machine, with its supports, weighs only 150 pounds. The guns employed are short rifle barrels—three only are employed in this machine; but the principle admits of quite an increase over that number. This formidable weapon consists first, of a wrought iron cylinder, ten inches in diameter, revolving upon its axis. This cylinder is pierced upon its circumference with eighty-four holes, arranged in rows of three each, parallel with its axis. The holes are so many chambers, which are successively brought before the three rifle barrels already described. A nipple is attached to each chamber, which, by an ingenious contrivance of ratchets, etc., are presented to a succession of caps, which have to be placed by hand in position on a revolving table, near the center of the machine, as the firing progresses. The powder is placed in a kind of hopper on the top of the machine, while the balls are placed in a similar hopper by the side of the former. On turning a crank, each series of chambers are in succession filled with a graduated quantity of powder, which is immediately covered with balls, and are lightly rammed by the same motion that places them in position. The caps are next placed upon the nipples, and exploded as they come opposite the barrels.

The entire machine works on a pivot, and can be readily pointed in any desirable direction. There seems to be no difficulty in operating the machine, which is simple in construction and easily handled. Three or four of such batteries could hardly fail to do immense injury in an enemy's ranks.

NEW MACHINERY.—The Golden State Iron Works are now making extensive hoisting works for the Bellingham Bay Coal company, and a 10-stamp mill for the Guadalupe and Sacramento company, Sinaloa, Mexico. The latter have ordered two of Hendy's new concentrators. We also noticed one of Hanscom's large size quartz crushers on the move at these works.

The Aetna Iron Works are quite busy. They have, among others, orders for a 15-stamp mill for G. V. Clark, Calaveras county; four of Wheeler & Randall's new pattern concentrators; ten of Dr. Hill's 5-foot pans for the Gentry mill, Washoe; Hessey's new amalgamator (just finished); iron front and other work for the new market to be erected on Pine street, between Kearny and Montgomery, by Messrs. Tevis & Davis. A superior sample of house front work, by Messrs. Hanscom & Co., can be seen on the Fireman's Fund Insurance company's building, corner Sansome and California streets.

PARIS EXPOSITION.—The California contributions to the Paris Exhibition went forward on the steamer of the 19th. From Panama they will go by the French steam line. Among them were the cabinet of minerals, and the splendid assortment of Mission woolen goods. The committee became personally responsible for the freight.

THE Colorado Salt works are in full operation. They are at South Park. The company, says the *Denver News*, will furnish salt of very fine quality, in that place, at seven cents per pound, or  $4\frac{1}{2}$  cents at the works.

## THE SACRED FIRES OF THE ANCIENTS.

Burning springs, as they were formerly called, have been found in about all parts of the globe. The Persians and Greeks regarded them as sacred fires kept up by the especial agencies of their divinities. They often built temples over them. Baku, on the Caspian Sea, was one of the sacred cities of the Persian fire worshippers; the whole neighborhood abounding in burning springs. The most extensive of these springs is known by the name of the "Perpetual Fire." It has been an object of great veneration from the earliest times, and its fires, which still burn, are said never to have been extinguished.

The fires upon the altar of the Grecian temple of Aegina were kept burning for many centuries, by means, as modern investigation has shown, of one of these burning springs. These fires were sometimes suffered to go out, and, as mentioned by both Plutarch and Strabo (of this and other sacred fires), when so extinguished, they were re-lighted by invisible means. The ruins of the temple of Aegina were carefully examined by an English traveler, a few years ago, when the following developments were made. Under the place where the altar stood was found a round hole about thirteen inches in diameter, in a block of stone. This circular orifice opens into a square one, which passes down through solid stone to a depth of several feet. The lower extremity of the square hole communicates with a cavity in which a fire is supposed to have been constantly kept burning, so that the flame did not appear above the surface of the fissure. Nothing more would be necessary, when it was desired to produce a fire upon the altar, than to pour oil upon the same, which, communicating with the flame below, would set fire to the sacrifice upon the altar, as it were, in a miraculous manner; or by leading the gas jet a few inches higher, a perpetual fire might be kept up.

The Chinese refer to a spring which they say continued to burn constantly for eleven hundred years—from the second to the thirteenth century. It is only quite recently that the true origin of these phenomena has been understood. In pursuing investigations to determine the cause, they were first referred to coal; some, doubtless, may have had such an origin, but the more recent borings for petroleum have pretty conclusively shown that they should be chiefly referred to the oil strata, and that they are fed from the volatile constituents of this modern illuminating agent.

TO OUR NEIGHBORS.—We return our sincere thanks for the numerous editorial expressions of approbation and good-will which our exchanges have of late contained. Since we donned our new dress, compliments have been showered upon us. The *Dutch Flat Enquirer*, the *North Californian*, the *Amador Ledger*, the *Downieville Messenger*, the *Marysville Appeal*, the *Alpine Miner*, the *Owyhee Avalanche*, the *Reese River Reveille*, the *Esmeralda Union*, the *Times* of this city, the *Evangel*, the *Sacramento Bee*, and the *Placerville Courier*, have each said something gratifying to our "love of approbation" bump. Our space will not permit us to copy all the notices, but we append the last named as an example.

MINING AND SCIENTIFIC PRESS.—With the issue of Saturday last, this journal entered upon its fourteenth volume, and its general appearance is sufficient proof that it is in a flourishing condition, as it deserves to be—for it is filled to overflowing from week to week with interesting and instructive reading matter. To the miner, especially, it is as well worth the price of subscription as any public journal on this coast. The first number of the present volume is printed on type made in San Francisco—the first of the kind ever used.—*Placerville Cour.* Jan. 12th.

A WHALE got caught between the screw and the frame of the U. S. Propeller Mohican, the other day, and stopped the movement of the engines.

**AGRICULTURAL STATISTICS.**—Secretary Hoag, of the State Agricultural Society, appears to be a live man in his place. His efforts, and those of his associates, in the management of the State Society, are well directed and energetic for the advancement of our agricultural interests. The State Board of Agriculture has addressed a circular to the people of several counties, urging the importance of a system of organization and co-operative effort, and more diligence in the collection and discrimination of statistics, by which our farmers may be put in possession of seasonable and correct information with regard to the productions of the State, and the condition of its markets, as well as the productions and market rates of other sections and countries. The possession of such information is indispensable to intelligent, profitable farming. The National and some of the State Governments have initiated a policy of this kind, which is proving of inestimable value. In no portion of the Union can such information be made more serviceable than in California. The rapid advance which this State is making in her agricultural productions, renders it of the highest importance that that portion of our domestic industry should be stimulated and guided by an intelligent and comprehensive policy. When proper arrangements have been made for gathering the desired statistics, the Secretary of the State Board proposes to issue a monthly circular, which shall contain all said information carefully tabulated, advance sheets of which will be furnished the press for general publication.

**THE LATEST STEAMBOAT IMPROVEMENT.**—Mr. William Morrissey, of this city, has invented what he calls an improvement in steam vessels, which may be described as follows: The wheels are placed in pairs, one upon either extremity of shafts, as arranged upon such boats as work both wheels upon one shaft. Two or more pairs of wheels can be arranged upon each side of the boat, and, if desirable, one before and another abaft the boat. These latter wheels can be placed in adjustable slots, so as to act as steering wheels, by varying their angles with the direction of the boat, in the same manner as an ordinary rudder is worked. Such an arrangement may also make the boat a double-ended, thus avoiding all necessity for turning round.

The wheels, instead of being made in the ordinary manner, have their floats placed upon the circumference of water-tight cylinders, which, by their buoyancy, admit of a boat so propelled being run in very shallow water, or in narrow streams, for which description of navigation this improvement is intended. Application for letters patent for the above has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

**NEVADA AT PARIS.**—The *Reveille* says that Nevada will be splendidly represented at the Paris Exposition. Some tons of rich and beautiful ore will be forwarded. A full representation of the whole country from the Humboldt to the Colorado is designed. Maps, sketches and photographs of prominent objects of interest will also be provided. The wealthy companies will bear the expense of forwarding their own contributions. Public-spirited gentlemen will represent the State, paying their own expenses. All classes will be called upon to contribute something toward paying other expenses that may accrue. In the Nevada Legislature, a House Bill was passed on the 24th, appointing D. E. Buell and J. F. Lockhardt, Commissioners.

**ROSS BROWNE'S REPORT.**—A telegram dated January 24th, says: The report of Ross Browne, with 5,000 extra copies, was ordered printed yesterday.

A FOUR THOUSAND horse-power steam engine will do the pumping to supply the Great Exposition building with water.

**ANOTHER PETROLEUM REFINING COMPANY.** An association, to be known as the "Pioneer Petroleum Refining Company," has filed articles of incorporation, with a capital stock of \$50,000; Charles Stott, David Hunter and Chas. H. Wakelee, constitute the first Board of Trustees. Their principal place of business will be in this city. This company proposes to conduct the business of refining petroleum, on a principle quite new, or at least differing very materially from any process now in use on this coast. Steam is their chief heating agent employed, and is applied directly to the body of the crude oil itself, and gradually increased in temperature and pressure, as the oils to be driven off become more and more heavy. It is claimed that by this process the oil comes from the still ready for use, requiring no subsequent refining or working, either by acids or any other agent, thereby greatly reducing the cost of the process. If this principle succeeds, it must result in a very material cheapening of the price of coal oil.

**CRANBERRIES.**—New Jersey people are devoting much attention to the culture of this crop. Wherever there is a piece of land that is good for nothing else, it is planted with cranberries. Certain bogs have yielded at the rate of 220 bushels to the acre, worth about \$1,250! Two brothers Budd purchased a cedar swamp five years ago, for \$10 per acre. They set out cranberries. Last year they received \$7,200 for the produce of twenty-eight acres of it. They have been offered \$600 per acre for the whole tract. Thousands of acres in Michigan are being turned to this use. One man, a Mr. Bruner, has commenced work with \$100,000 capital, all of which he proposes to invest in the business of cranberry raising. One advantage which this crop has, is that the bushes never need replanting, but will last for all time with scarcely any care.

**CASTOR BEAN.**—An acre of land in eastor beans, will yield \$40 on the average. The oil is worth \$1.50 per gallon. But one great difficulty in the business is that the seeds do not all ripen at the same time. Many are lost by the popping open of the pods, for it will not pay to gather them up. The *Marysville Appeal* says: "Some plan has got to be adopted to remedy this evil before eastor bean growing can be made very profitable. Who will invent a machine to gather these seeds? Or who will devise some plan to stop the popping of the buds? The stalks may be cut as soon as the first pods ripen, but will the unripe beans ripen, and will green beans make good oil? These are questions which arise, and must be decided by experiment. The crop will be largely experimented upon next summer."

THE NEWS from Ottawa, Canada West, December 15th, is as follows: The Commissioner of Crown Lands has received from the Inspector of the Madoc gold region, rich specimens of gold, in quartz and sand. Inspector reports mining carried on in five concessions in Madoc, and the four concessions of Huntington. From one lot between \$1,000 and \$1,500 have been taken out. Gold was first struck at a depth of twenty feet. From the specimens of quartz seen, the Inspector is of opinion that gold exists through the townships of Rawdon, Madoc, and Ellisever, and portions of Marmora and Tudor. Three thousand persons visited the mining regions last month.

THIRTY-EIGHT years ago, an Indian woman rode on horse-back from Los Angeles to Santa Barbara, using a piece of grape-vine as a switch. On reaching her destination, she stuck her switch into the ground. It took root, and sixty barrels of wine were made last season from its fruit.

THE SOLDIERS' MONUMENT, of Boston, is to consist of an obelisk 120 feet high, and will be built of Concord granite. It will be surrounded by an appropriate figure and placed on Flagstaff Hill.

THE *Vedette* of January 3d, says that it is reported that a party of nine miners started about a month ago from Pahranaagat, on a prospecting tour towards the Colorado river, endeavoring to strike a point below St. George. They were in search of copper. When about fifty miles from Callville they were attacked by a band of Indians, supposed to be Navajoes, and the entire party slain.

Since the above was in type, we have received the *Vedette* of the 12th, from which we clip the following: "We are pleased to announce that the party of nine miners, who were supposed to have been murdered by the Indians on their road from Pahranaagat to the Colorado, have returned in safety. They were attacked, but retreated without the loss of a man. Mr. Rosenbaum, who arrived in the southern stage last evening from Pahranaagat, is our informant. Mr. R. confirms the good report, recently received, of the plentiful yield of the precious metal in that section of the country."

THE UNION COMPANY'S CLAIM.—It is said that the Union and Consummes lodes in El Dorado county, mentioned in our last issue, as recently sold to a New York company for \$1,200,000, are like the the Harpending or Banker mine in Placer county—immense vein-like masses of friable rock, easily mined and easily worked.

A QUARTZ MILL FOR NOTHING.—The *Placer Herald* says that one of the proprietors of the Miner's Foundry, San Francisco, recently visited Auburn, and offered to put up a mill on any ledge which would pay \$20 per ton, run it until it paid for itself, and then turn it over to the company owning the mine.

SILVER IN NEW YORK.—Otis Marsh, of Alleghany county, is said to have found a rich vein of this metal on his farm. At the depth of forty feet he found native silver in a bluish quartz. A New York assayer pronounces the ore worth \$1,500 per ton. There was considerable excitement, and the lands in the vicinity have suddenly risen in value ten-fold. So says the *Angelica Reporter's* correspondent.

THE Gold Hill *News* says that sixteen millions of dollars was lost in that vicinity in 1866, owing to imperfect methods of working silver ore; and urges the propriety of offering, by Legislative Act, large inducements to inventors and scientific men to direct their attention to this point.

A REVERSIBLE BOOT HEEL is the last hit of some Yankee genius. When worn down a hair's breadth or so on one side, it can be turned and worn down on the other, and so *ad libitum*. A patent has been applied for.

BORN.—In this city, January 11th, a son to C. W. M. SMITH, one of the proprietors of this journal.

From the commencement of Volume XIV of the MINING AND SCIENTIFIC PRESS, only a limited number of copies will be saved for files by us; consequently those who desire the paper for future as well as present value, should subscribe at once.

### Generous Compliments.

The following is a sample of the generous acknowledgments which we frequently receive. We can only return thanks for such gentlemanly obligations, and assure our friends of our best endeavors to merit their respect and kindness: GROCERTOWN, January 22, '67. MESSRS. DEWEY & Co.—Sirs: I have the honor to acknowledge receipt of your letter of the 21st instant, transmitting to me "Ladies' Patent" on my application through you for an "Improved Machine for Washing Ore." It came to hand safely, and I am pleased to tender you my grateful acknowledgments for your success on my behalf. Very truly yours, M. A. WOODSIDE.

**COAL OILS AND LAMP STOCK.**  
21v12-3m9p

A CALCULATION, recently made by a correspondent of the *London Mining Journal*, gives these figures: British railways, including preference shares, mortgage loans, etc., pay on the average, 3½ per cent.; the 350 mines in the Mining Share List, including copper, lead and tin, 13½ per cent. This shows an advantage of 10 per cent. on investments in sound mining adventures.

### STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

### Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the divs.  
Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

**A. S. Hallidie & Co.,**  
MANUFACTURERS OF  
**FLAT & ROUND WIRE ROPE,**  
For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay street. . . . . Works—North Beach.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer these interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.  
We manufacture of all sizes, and in any length—  
**Round Wire Rope—Iron or Steel, for Hoisting.**  
**Flat Wire Rope—**

**Soft Steel Wire Rope—For Derrick Fall Ropes—**very strong and durable—one-third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.**  
**Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.**

**Iron and Copper Wire Cord—**½ to ½-inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps, Mill Sectors of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. H. J. BOOTH'S PATENT QUARTZ CRUSHERS, of all sizes.

**ENGINES.** Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable On-off Regulator—best in use. W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.** The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenus Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Printer's concentrators, Wakley's pans, Bisco's pan, German Barrels, Astra Centring Chle Mills. Sectors of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. H. J. BOOTH'S PATENT QUARTZ CRUSHERS, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russell Iron Sectors, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

A SUBTERRANEAN RIVER.—"Dan de Quille," in a letter from Downieville to the Territorial Enterprise, speaks of a number of "large circular sinks" in the bed of a ravine in Sierra county. He says:

Some have mistaken them for the craters of extinct volcanoes, but they are evidently formed by the settling down of the gravel in the cañon into the caverns of the rock below. In one of these sinks a party of miners once sunk a shaft to the depth of eighty feet without finding the bottom. At the time of my visit a new hole had broken out below the large ones I have mentioned. The hole was circular, and its sides as smooth as though dug by man. It was about fifteen feet deep, with a passage about the size of a common tunnel leading from the bottom. Being alone and without a rope or caudle, I could only look at this curious 'hole in the ground' from the surface. Afterwards a party was made up to go with ropes and a proper outfit to explore the cavern, but a storm prevented our going. Judging from the immense quantities of earth that must have been sucked into the ground, there must be a vast cavern or range of caverns underneath. As the gravel which has been swallowed up is all rich in gold, who knows but there may be a subterranean stream there whose bed is paved with gold? The lime belt strikes westerly to Brithes' Ranch, where burst forth a number of springs, affording from two to four hundred inches of water. Many think that these springs are the outlet of the caverns.

**RAILROAD RULES.**—The following rules are based upon legal decisions, and ought to be universally known. The courts have decided that applicants for tickets on railroads can be ejected from the cars if they do not offer the exact amount of their fare. Conductors are not bound to make change. All railroad tickets are good until used, conditions "good for this day only" are of no account. Passengers who lose their tickets can be ejected from the cars unless they purchase a second one. Passengers are bound to observe decorum in the cars, and are obliged to comply with all reasonable demands to show their tickets. Standing on the platform or otherwise violating the rules of the company, renders a person liable to be put off the train. No person has a right to monopolize more seats than he has paid for; and any article left in the seat, while the owner is temporarily absent, entitles him to his seat on his return.—Times.

On the morning of December 22d, as the Eastern train on the Shore Line from Providence, R. I., was about a mile from that city, the engineer discovered the body of a man lying between the rails. Owing to the icy state of the track the train ran about a mile before it could be stopped, when it was backed down, and it was found that the man was uninjured. He was dead drunk, and the whole train passed over him without waking him from his stupor.

MOUNT HOOD has left off smoking.

25v12-3m

**OIL IN TENNESSEE.**—A letter from Dixon's Springs, Smith county, Tennessee, December 12th, has been shown to the editor of the *Enterprise*. We quote:

Last Thursday two weeks, at the depth of 338 feet, we struck oil. The auger—weighing seven hundred pounds—was thrown out far above the top of the tallest trees, and having a slight inclination, described the arc of a circle in its course, falling far from the works. For five hours the oil, with water and stones, were thrown out in a manner and with a noise at once grand and inspiring; truly beyond my power to describe. No one was hurt, and there being no fire near, no other damage was done than the demolition of the derrick, etc.

The loudest noise ever heard by man, was probably that produced by the great meteor which passed over the State of Ohio on the first of May, 1860. The noise of its explosion was distinctly heard throughout a district of country whose diameter was 150 miles.

## THE PACIFIC IRON WORKS,

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greene Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

SHAW, San Francisco, care Mining and Scientific Press. 14v13-1m

## CONNECTICUT

### Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

### THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Business,  
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1863.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies in which Life Insurance is applicable, among which forms are—

**Whole Life Policies,** by a continued annual life premium.

**Whole Life Policies,** by TEN annual premiums.

**Endowment Policies,** by a continued annual premium.

**Endowment Policies,** by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

**Endowment Policies,** made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one HALF. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

### DIRECTORS:

JAMES GOODWIN, HENRY C. ROBINSON,  
GEORGE S. GILMAN, GUY R. PHELPS,  
MARCUS F. HOLMES, E. D. TIFFANY,  
New York. CHARLES F. THAYER,  
N. M. WATERMAN, Boston.  
E. B. WATKINSON, JOHN C. PALMER,

O. W. POWERS, Actuary.

**A. D. SMITH & CO.,**

General Agents Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13 p11

## Accidental Insurance!

### The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

### ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

### SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month,	2-10.	4 months,	5-10.
2 "	3-10.	5 "	6-10.
3 "	4-10.	6 "	7-10.

### GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$5,000, and \$25 per week compensation, against Accidents of every description, Traveling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance in which the assured may at the time be traveling," but they are GENERAL ACCIDENT TICKETS.

### SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

### INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

**A. D. SMITH & CO.,**

General Agents for the Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets San Francisco. 17v13

The gold mines on the Potomac river, a few miles above Washington, are being profitably worked, and expensive machinery is being erected. A new company has just commenced operations, with General Denver, formerly of Colorado, as President.

#### PATENT BUSINESS.

We have lately associated with us in the Patent and Me-  
chanical Department of the Mining and Scientific Press, a  
gentleman of superior ability and attainments, who has  
arrived direct from the leading patent agency in New York  
City, and having a faithful and reliable associate in Wash-  
ington City, we are now better than ever before prepared  
to secure the claims of our applicants, in a careful, prompt  
and efficient manner. DEWEY & CO.  
San Francisco, June, 1866. Patent Solicitors

A splendid paper, and should have a good list of sub-  
scribers in prosperous Grass Valley.—[G. V. National.

## New Mining Laws of California and Nevada.

We have just issued, in cheap edition, the new laws relating to mining and corporations in California and Nevada, passed in 1865-6. Some of these laws are of the highest importance to parties interested in the matter of locating and holding claims, and prospecting mines, in these States. Copies sent by mail. Price, 25 cents.

Address, DEWEY & Co., Patent Agents.  
San Francisco, May 1st, 1866.

## New Mining Advertisements.

## Cosita Silver Mining Company, Cosita District, State of Mineral, Mexico.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the seventh day of December, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Arroy, Walter W.	50	25	25 00
Arroy, Walter W.	50	25	25 00
Brown, P. J.	605	25	25 00
Clutman, T. P.	568	25	25 00
Frederick, James	604	50	50 00
Kelley, J. C.	604	133	133 00
Murdoch, A. H.	605	25	25 00
O'Brien, Thomas	604	25	25 00
Elce, T. M.	587	5	5 00
Thompson, I. D.	555	25	25 00

And in accordance with law, and an order of the Board of Trustees, made on the seventh day of December, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the auction rooms of Maurice Dore & Co., No. 27 Montgomery street, San Francisco, Cal., on Monday, the eleventh day of February, 1867, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, No. 510 Battery street, opposite the Custom House, San Francisco, Cal. Jan 25

## Hudson Copper Mining Company, Low Divide District, Del Norte County, California.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the twenty-second day of December, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Rydalor, John	12	1 1/2	1 10
Guyard, Charles	50	51	2 30
Hulley, Eben	2	2	2 30
Huyas, Geo. K.	74	100	15 00
Kelley, Simon	83	13	13 25
Powers, C. A.	40	40	5 00
Reed, Sarah M.	11	26 1/2	4 00

And in accordance with law, and an order of the Board of Trustees, made on the twenty-second day of December, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the Secretary's office, No. 69 Market street, San Francisco, Cal., on Friday, the eighth day of February, 1867, at the hour of 12 o'clock, M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, No. 69 Market street, San Francisco, Cal. Jan 26

## Keystone Mining Company, Location of Works Copperopolis, Calaveras County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-first day of November, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of December, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Joseph & Company, auctioneers, in the building southeast corner of Pine and Montgomery streets, in the City and County of San Francisco, State of California, on Wednesday, the twentieth day of February, 1867, at the hour of 11 o'clock, A. M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, No. 43 Exchange Building, N. W. corner of Montgomery and Washington streets, San Francisco, California. Jan 26

## Mining Notices—Continued.

## Arizona Consolidated Mining Company, Encina District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1867, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, at the office of the Company, No. 611 Clay street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 611 Clay street, San Francisco. Jan 19

## Big Blue Lead Gold and Silver Mining Company.

Location of Works: Kern County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of January, 1867, an assessment of ten dollars (\$10) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, M. G. Elmore, at his office, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twelfth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 302 Montgomery street, San Francisco. Jan 9

## Dios Padre Gold and Silver Mining Company.

Location of Works: Alamos, Mexico.

Notice.—There are delinquent upon the following described stock, on account of assessment levied on the fourth day of December, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
William Bihler	229	25	125 00
William Bihler	323	5	25 00
William Bihler	411	25	125 00
William Bihler	412	25	125 00
A. C. Treachy	371	145	425 00

And in accordance with law, and an order of the Board of Trustees, made on the fourth day of December, 1865, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by Messrs. Olney & Co., 418 Montgomery street, San Francisco, Cal., on the twenty-ninth day of January, 1867, at the hour of 12 o'clock M. of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

Office, No. 1 Government House, corner Sansome and Washington streets, San Francisco, Cal. Jan 5

## Evoca Consolidated Copper Mining Company.

Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of January, 1867, an assessment of twenty-five cents (25) per share was levied upon the assessable capital stock of said Company, payable on the eleventh day of February, 1867, in United States gold and silver coin, to the Treasurer, A. E. Thayer, at the office of the Company, at No. 332 Merchant street, Room No. 3, in the City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twelfth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirteenth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office of Company, No. 332 Merchant street, Room No. 3, San Francisco, California. Jan 9

## George Washington Gold and Silver Mining Company.

Location of Works: Silver Mountain District, Alpine County, Cal.

Assessment No. 16.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirty-first day of December, 1866, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the ninth (9th) day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of February, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 338 Montgomery street, San Francisco. Jan 5

## Hope Gravel Mining Company.—Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1867, an assessment (No. 12) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable on the twelfth day of February, 1867, in gold and silver coin of the United States, to David Wilkie, Secretary, at the office of the Company, No. 529 Clay street, San Francisco.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-third day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, No. 529 Clay street, San Francisco, Cal. Jan 9-5w

## Julia Gold and Silver Mining Company, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of January, 1867, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, 607 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixteenth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the sixth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, 607 Washington street, San Francisco, Cal. Jan 2

## Josephine Copper Mining Company. Location of Works: Gopher District, Calaveras County, California.

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the twenty-eighth day of November, 1865, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
J. S. Cronise	174	50	\$50 00

## Machinery.

## V. CUSHING, Agent

—FOR THE—

Purchase & Shipping of Machinery  
OF ALL KINDS.

Especial attention given to **Quartz Mill Machinery** and **Findings**, and **Miners' Material** of every description.

Being a **PRACTICAL MACHINIST**, and giving my personal attention to the execution of orders, I can guarantee the **BEST** class of work at the **LOWEST PRICE** in the city.

Refer, by permission, to—

Governor P. F. Low, San Francisco; G. T. Meador, Stockton; Jacob Underhill & Co., San Francisco; J. W. Stowe, Russell & Erwin Manufacturing Company; Office, No. 120 Front street, San Francisco. 4v12

## HUNTER'S

## IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the **UNION FOUNDRY**, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

## VARNEY'S

## PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as the Follows:

The pan being filled, the motion of the mill forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is drawn to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Scalers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the **PACIFIC FOUNDRY**, 1v1 San Francisco.

## BRUCKNER'S

## Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1865.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which

ORRATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
19v12 416 Market street, San Francisco.

## Notice to Miners,

## Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,  
8v13-1y Stove Store, No. 125 Clay street, below Davis.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Crushing Quartz, or other Rocks, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advantages are enabled to offer these machines to the public at the following low terms:

No. 1—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$600

No. 2—Or 15-inch Crusher, capable of similarly pitting through five to six tons per hour, \$850

No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour, \$1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in rotation with the link, D, gives the movable jaw, A, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county, California, dated Sept. 28, 1865.

JAMES BRODIE, Esq., San Francisco—My Dear Sir: I give you pleasure to inform you that I have for the past three months had one of your latest sized Rock Crushers in use at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply, and properly preparing quartz for the stamps. Yours truly,

R. P. JOHNSON,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1865, the royalty charged for using the same will be raised to the sum of \$500 per barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1865.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1865.

## Job Printing Press for Sale--\$250.

A Largest Size (half medium) RUGGLES' BEST JOB PRESS, in fine order and good as new, can be had for \$250, cash—lowest price. Warranted. Apply to

DEWEY &amp; CO.,

Mining and Scientific Press Office.

**Economy in Advertising.**—The MINING AND SCIENTIFIC PRESS is the best and most economical mining advertising medium in this city. Our terms are less than one half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

A NEW PROJECTILE.—Mr. Gale, whose inventions in the line of firearms and ammunition is already well and favorably known, has recently devised what he calls a "rudder-tail bullet." The explosive by which it is propelled is not powder, but a fulminate, 25 per cent. stronger than ordinary gunpowder, with which a strip of paper is saturated. The following description will convey a very clear idea of both the fulminate and the form of the bullet, if such this curious projectile may be called:

Suppose this strip coiled around the shank of a common round-headed hobnail, and a percussion cap stuck on its point. Now a bullet very like in form to this hobnail, is what Mr. Gale calls his rudder-tail ball. At the first glance it is evident that the lever attached to the ball must make it fly straight. The rudder-tail converts it into a short dart, and the leverage of the shaft must act upon the air without cessation and keep the point of the head always straight to the mark. This ball may be fired from a smooth-bore or a rifle; it would fly straight, projected from either. This fulminate is composed of chlorate of potash and other substances. Paper, linen, and fibrous materials are saturated with it, and the sheets rolled up and cut into cartridges of various diameters and lengths, according to the operations for which they may be required. Such a cartridge roll can be pushed at once down into the blasting hole, and the damp or wet condition of the rock will in no way affect it, as the cartridge is thoroughly water-proofed, and might even itself be used to drive the water out of the hole. It can be manufactured quite as cheaply as, if not far less than gunpowder; while the preparation of it is quite harmless and not dangerous, there being no risk of explosion in the mixing or saturating processes. Mr. Gale has also perfected what he calls a fog shell and a halloon-shell, the last of most destructive properties. The object of the fog shell is that, thrown on board ship it will, after a certain lapse of time, generate a dense vapor through which the sailors and marines shall find it impossible to see, and therefore to defend themselves with any certainty; or it may be used, on the other hand, for producing a dense cloud behind which a ship may itself escape attack. The halloon-shell is filled with a fulminate which may be dropped from any height and exploded by its fall. This fulminate is said to be so fearfully explosive that a shell off-inch diameter will be equal to clearing a large space or area of some hundreds of square feet of all but ponderous objects.

ARIZONA—SUCCESSFUL MILLING.—A correspondent of the *Alta*, writing from Prescott, Arizona, under date of Dec. 16th, 1866, speaks as follows of the yield of several quartz mills which have recently been started in that Territory:

The run of the Sterling mill last week cleaned up \$100 to the ton, and the tailings show that they do not save all the gold. Berger & Co.'s mill, on Big Bug, is running, and so far they have cleaned up from \$40 to \$60 per ton. I think they have a fine prospect before them for a fortune, as they have the best mill in all Arizona. Woolsey's water mill, near Big Bug, is running and doing well for a 5-stamp mill. He has cleaned up from \$45 to \$116 to the ton from the Ticonderoga mine. Tyson & Co. are doing well on the Eureka, and they cannot save all their gold for the sulphurets. Col. Coffin will start his mill on the Bully Bueno mine this week. They have 500 tons of ore on the surface that promises to pay well. Mr. Noyes is progressing rapidly with his mill, on the Umpqua mine, which, judging from the work done on it, bids fair to be counted among our best mines. Taking all our mines together, the prospects are as good as any one could wish for a splendid outcome in the spring. Wages are fair here, being from \$75 to \$125 per month and board for good miners. The Indians have been very quiet of late.

RAISINS.—The raisin' of grapes for raisins is beginning to be carried on to considerable extent in Tulare county. The *Delta* says the California or Mission grape, is not a true raisin grape. It is all skin and bone when dried. A heavy pulp is essential. The Rose de Peru, the Muscat of Alexandria, the Red and White Syrian, the Black Hamburg, and especially the Fierzago, are well suited to this purpose. California raisins will yet take the place of the imported.

A CONNECTICUT man by the name of Phillips, invented friction matches in 1832.

**WHERE IS THE OUTLET?**—We clip the following from the *Reese River Recaller*:

In a small valley lying between the districts of Hot Creek and Keyville, about one hundred and twenty miles southeast of Austin, there is a group of springs, fifteen to twenty in number, which teem with fish. The springs are circular in form, and vary in diameter from one foot to fifteen feet. They are reported to be of great depth, and frequent attempts have been made to sound them, but no plummet cast into their waters has ever found bottom. In every instance the water of the springs was found to be icy cold and beautifully limpid. They abound in fish of one variety, a species of chub, ranging from six to eighteen inches in length. A party of men, recently encamped in the vicinity of the springs, caught three hundred of these chubs in a short time, and found them a delicious variety in their ordinary bill of fare. These springs, as they are called, are supposed to be the openings on the surface of a subterranean lake, or "sink," whose outlet or inlet has not yet been observed.

Great numbers of the same kind of "springs" are found not far from Black Rock, in Northwestern Nevada. We have stood upon the matted grass, near those springs, and by a slight action of the body shaken the ground for half an acre around; showing that the earth upon which we stood was but a thin crust of turf and soft mud, overlying a vast subterranean lake. Like the springs referred to by our Reese River contemporary, they were of a depth unfathomable by any means then at hand—nor have we heard that the depth has since been ascertained.

**GOULD & CURRY.**—The average value of ore from this mine when first opened in 1860, was, as appears by the Stock Circular published in our issue of January 12th, \$156 per ton. In 1866, it was only \$28. The principal cause for this decline in value, says the *Times* of this city, arises from the fact, that in proportion as the working of the mine increased in depth, the more pure the silver becomes, while nearer the surface the proportion of gold was large enough to make one ounce equal in value to six ounces obtained 600 feet deep. This remarkable depreciation in the value of Washoe bullion is a matter of deep interest to men of science as well as the owners of feet.

**SUTRO TUNNEL.**—The Gould & Curry and the Hale & Norcross Companies will each aid the Sutro Tunnel project to the amount of \$100,000.

Our Patent Agency.

The Patent Agency of the Mining and Scientific Press has been signalled with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of Letters Patent from the United States and foreign Governments cannot be over-rated, and the Proprietors of the Press, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

## Gaston's Screw Grinder and Amalgamator

—is—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect sifter. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

Abdominal Supporters!

Shoulder Braces, Etc., Etc.

WE WOULD CALL THE ATTENTION OF DEALERS and others to our complete assortment of these goods, including HARTLEY & Roman's celebrated KALL AND SOCKET REVERSIBLE TRUSS, which is decidedly the best article ever introduced into this market. By a combination of the movement of the ball and socket, and the movable arm, any desired angle may be obtained. Call and examine for yourselves. A liberal discount to the trade.

SHEPARDSON & GATES, Agents,  
Corner Sansome and Commercial streets.

22v13-3m

## Rheumatism!!

Still Another Witness!

(White Oak Township, El Dorado Co.,  
LATROBE, Cal., Sept. 19, 1866.)  
This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.  
About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably put it to flight. I therefore cordially recommend it to the afflicted as an unfailing remedy for Rheumatism.  
FRED'K FABER.

FOR RICHARD'S REMEDY is for sale by  
**H. BOWMAN, Druggist, Sacramento,**  
And by Druggists generally.

**"THE BEST."**

(Signed)

J. N. ANDREWS,  
THOMAS C. McHALE,  
L. ELKUS.

If there is a FLORENCE SEWING MACHINE within one thousand miles of the San Francisco Office, that is not working well and giving perfect satisfaction, it will be attended to, if I am informed of it, without expense to the owner.

**SAMUEL HILL,**  
General Agent, 111 Montgomery street, San Francisco.  
17v13

**LEGAL WEIGHTS OF GRAIN.**—According to Act of Congress, the duties upon grain importations are estimated upon bushels ascertained by weight, and not by measure. Sixty pounds of wheat, fifty-six of corn, fifty-six of rye, forty-eight of barley, thirty-two of oats, sixty of peas, forty-two of buckwheat, avoirdupois weight, are respectively estimated as a bushel.

The offer of sixteen hundred thousand dollars has been made for the admission fees to the Paris Exposition; one-half of this sum to be paid at once, the other at the opening. Although this would have secured the guarantors from all risk, the offer was declined.

**TISSUE PAPER** is now used by Vienna surgeons as a substitute for lint. It is cheaper, and in many cases will answer the purpose perfectly.

**FAXON & BROWN** have an extensive soapstone quarry near Sonoma in Tuolumne county. It is of the finest quality. They are now working it.

THE OLDEST BELL in France was first put in position in the year 1001. It still chimes out its notes, as of old, near La-Clayette on the Loire.

TWENTY tons of postage stamps have been used during the past year, says the *Scientific American*.

### Consumption Cured.

FULTON, Hamilton Co., Ohio, May 19, 1863—Gents: This is to certify that my daughter was taken with a severe cold, which settled upon her lungs, attended with violent coughing. The cough became incessant and distressing, with pain and great difficulty of breathing. It went on until she was nearly dead, when she raised large quantities of phlegm and matter. The attending physicians examined her, and said that they thought one of her lungs was almost gone, and that they believed she could not be cured, as she had the last stages of consumption. At this time she was induced to try ALLEN'S LUNG BALSAM, having heard of its many remarkable cures. On using the Balsam, it seemed to go to the very seat of the disease at once, as it caused her to expectorate large quantities of phlegm. The cough began to mend; the soreness of the lungs was relieved; the strength and appetite returned. By the use of only three bottles, she, to all appearances, had recovered her health, and now feeds as well as ever. Respectfully yours, LUCIUS PECK.

Sold by all Medicine dealers everywhere. 1v14-1m

ESTABLISHED [MAR, 1860.]  
VOLUME FOURTEEN

Mining and Scientific Press,  
COMMENCING JANUARY, 1867.

## HENDY'S CONCENTRATOR.

### Hendy's Improved Patent Self-Discharging Sulphurets PRATER CONCENTRATOR Is Receiving Universal Favor.

Reference is made to the following Mills which have them now in use:

BENTON MILL, Bear Valley, Mariposa County.  
LOUISIANA MILL, near Goulterville, Mariposa County.  
OPHIR MILL, near Newcastle, Placer County.  
C. H. SCHNABEL'S MILL, Dry Flat, Placer County.  
JERSEY BLUE, near Folsom, Cal.  
SPRING HILL MILL, Amador, Amador County.  
GOLDEN GATE MILL, Valcano, Amador County.  
RAWHIDE MILL, Jamestown, Tuolumne County.  
TRIUNFO O. & S. M. CO., Lower California, Mexico.

And in use in many other parts of this State; also in Idaho, Arizona, Colorado and Mexico.

### Hendy's Latest Improved Concentrator, for Gold and Silver Ores, With Revolving Stirrers and Rotary Distributor.

By this improvement the conical feeding distributor has been entirely done away with. The feed in this machine is made to enter the conical hopper; from thence it passes through the hollow arm, leading to the T attachment, marked D, which is made to sweep slowly around the circumference of the pan, by means of the roller teeth upon the upper edge of the same, into which two pawls are seen to work. This motion is obtained from the vibrating action of the pan, as in common use. Upon the under side of the T attachment to the arm, are small openings or perforations, through which the pulp is dropped from the feeder into the pan. The constant revolution of this arm secures a more uniform feed than can be obtained from the conical feeder. A set of stirrers, with small projectors or teeth is shown, which is also kept in revolution with the feeding arm, the design of which is to prevent the sand from packing near the center, where the motion is diminishing. The discharge orifice and box for receiving the sulphurets will be readily distinguished at box C. These pans may be so connected, as in the cut, that two can be driven by one shaft and pulleys. These machines have been thoroughly tested, and pronounced a perfect success.

#### Certificates:

JOSHUA HENDY, Esq.—Dear Sir: I have been using three of your Improved Concentrators for the past four months, at the Spring Hill Mill, and they give perfect satisfaction.  
Yours truly,  
WM. H. HOOPER.

Two of these Improved Machines have been ordered by Mr. Hooper, for the Gold Hill Mill, at Grass Valley.

JOSHUA HENDY, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that the four "Improved Self-Discharging Prater Concentrators," which I purchased from you, have now been in operation in the Rawhide Mining Company's Mill for more than two months, and have more than realized my expectations. I am free to say it is the best Machine for saving Quicksilver, Amalgam, and Sulphurets that I have ever used or seen used for that purpose. I shall take pleasure in showing any one interested the Machine in operation, who will call at the mill. I shall need four more as soon as the balance of our mill is completed. Yours truly,  
R. P. JOHNSON, Superintendent Rawhide Mill Company.

This Machine can be seen at H. J. Booth & Co's, Union Foundry, First street, corner of Mission. For further particulars, send for a Circular. Address,

J. HENDY.

403 Montgomery Street, San Francisco.  
N. B.—The proprietor is prepared to furnish these Machines on thirty days trial, to responsible parties.

### Foundry for Sale.

A One-half Interest in the  
UNION IRON WORKS,  
SACRAMENTO,

Owned by William B. Williams, is offered for sale on the most favorable terms.

### A Good Bargain

May be had, as the proprietor is going home to Europe. It is seldom that so good an opportunity is offered for a sure and permanent investment. The business of the establishment is exceedingly flourishing, as can be shown. The Shop is of brick, new and well built. The lot is 85 feet front by 163 feet in depth, in a good location for this business, on Front street, between N and O streets.  
Inquire at the office of the Foundry, or address  
WILLIAM B. WILLIAMS,  
Sacramento, Cal.

MECHANICAL MISCELLANY.—  
A New Superheating Apparatus: Strength of Iron Under Different Conditions; Breakage of Steamboat Shafts; Plastic Slate Roofing; Fire-Proof; Effect of the Atmosphere on Long Projectiles.  
SCIENTIFIC MISCELLANY.—  
The Forest Trees of Australia—Valuable Oils: White Lead and Saltpeter; Condensing Fruit—A New Product To Assist Ignition of Powder by the Electric Spark; Lightning Rod Protection; Food for Plants; Mining Sewerage—Embracing late intelligence from the various counties and districts in California, British Columbia, Arizona, Colorado, Idaho, Montana, Mexico and Nevada.  
Mining Shareholders' Directory.  
Mining Stock Sales of the Week.  
San Francisco Market Rates.  
San Francisco Weekly Stock Circular.

**THE BULLION PRODUCT OF IDAHO AND MONTANA.**—The report of the Internal Revenue Collector of the district of Owyhee, Idaho Territory, shows that the total produce of bullion for that district alone, for the ten months previous to November 1st, 1866, which came before his official cognizance, was \$1,073,256. He reports that a large amount found its way out of the Territory under conditions of which he could get no account, which, together with the rich ore from the Poorman's mine, etc., sent East for working, reached fully to the value \$500,000. He estimates the product of that district for the entire year at over \$2,000,000. He thinks the yield of 1867 will reach \$5,000,000. It is estimated that at least \$12,000,000, in gold dust and bullion, has reached St. Joseph during the past year, overland, from Montana, Idaho and Colorado. When the railroad is completed to Colorado, and protection for settlers secured in our central territories, the yield of bullion from the localities named will be immense, while that of Nevada, California, and Arizona will also be proportionately increased.

**THE NORTHWESTERN MUTUAL LIFE INSURANCE COMPANY,** of Milwaukee, has established an agency here, and appointed M. G. Elmore general agent for the Pacific coast. This company was organized in 1859, and now numbers over fifteen thousand members, with nearly two million dollars assets, having doubled its assets within the last year. It is the largest company west of the seaboard cities. Its location where mortality is low and capital high must insure large dividends, and enable its managers to offer lower rates of premiums than those of other companies located where these advantages do not exist. United with these highly favorable features, the fact that it is a purely mutual company, dividing all its profits among the insured, must command a rapidly increasing patronage. The *Insurance Monitor* and *Wall Street Review* very truthfully say: "This company is worthy of that great, vital, essentially and incalculably rich and marvellously improving section of the Union from which it derives its title, and has acquired its present growth and bulk. We predict for the Northwestern Life a future which in brilliancy and increase will eclipse many of our most promising Life companies." We would advise those about insuring to call on the agent, 302 Montgomery street.

## Lyon & Isaacs's Self-feeding Drill.

This drill is especially well-suited for the use of carriage and car makers, and all others who are not so expert as machinists

lifting-lever, D, and set at more or less distance from the fulcrum, so as to give the proper feed-pressure upon the drill. The lever, D, is linked to the lever, C, the connection being inside the framing; and the

raised, lowered, and swung on its crane axis; and it has several rows of holes for holding bolts, so that work of nearly all kinds can be conveniently fastened to it. There is a recess, K, in the frame, to make room for large pieces; and holes may be drilled in any part of a piece of four feet diameter. Power is applied by a belt to the fast and loose pulleys, J, from which it is transmitted by another belt to the cone-pulleys on the shaft, I, I, on the end of which is a bevel-wheel gearing with a bevel-wheel on the vertical drill-arbor, L.

The drill has a gauge-check to limit the depth of the holes; and any number of holes may be drilled to the exact depth to which the gauge is set, without the need or trouble of measuring them; and this enables a boy to do the work that otherwise might require a skilled workman.

Upright drills have advantages that are bringing them into general use in machine-shops, and in wood-working shops. They occupy little room; the oil or other lubricant is sure to follow the drill, so that they may be run fast without heating; the weight—in this drill—insures a constant and safe feed, and thus turns out more work than is done by hand-feed; the weight of the vertical parts cause no friction; and the drill is instantly removed from and returned to its work by moving the left hand.

Drills on this patent, worked by power and by hand, are used by many machinists, horse-railway and omnibus companies, wagon and carriage makers, foundrymen, ship-smiths, iron railing makers, and many other manufacturers in the East. Address Lyon & Isaacs, Box 5,475, P. O., New York.

**NEW BUSINESS FIRM.**—The Messrs. Macdonald Bros., proprietors of Chace's sawing and planing mills, have consolidated in business at their old stand, with Mr. J. McGill, and H. Chapman, sash, door and blind manufacturers, under the new firm name of D. A. Macdonald & Co. For over ten years the Macdonald Bros. have been connected with the business of Chace's mill. All the partners are pioneers in their respective branches of business, thoroughly conversant with the practical work of their trades,

and know well the wants of this progressive field of industry. A new two story building will be immediately added to their works, fronting forty-four feet on Market street, and eighty-five in depth. We know this firm to be composed of most estimable men, and are pleased to note their progress and business success.

LYON & ISAAC'S SELF-FEEDING DRILL.

as to be able to feed a drill fast enough without breaking it. It was patented by Lyon & Isaacs, 9 Jane street, N. Y., in 1865, and described in the *American Artisan* of May 9th, 1866, as follows: The feed is forced by the weight of the fly-wheel, A, on the drill arbor, L; and when drilling small holes, for which the weight of the wheel would be too great, a counterweight is put upon the

lever, C, is linked to a pivot joint, B, on the top of the drill-arbor, so that it may lift it from its work, or sustain part of its weight while it is at work. The hand-rod, F, by which the first lever, D, is worked, has on its lower end a hook, which hooks into the staple, G, when the drill is to be held up clear of the work-table, H, while the work is being adjusted. The work-table can be

(Written for the Mining and Scientific Press.)

## Plumbago--Graphite--Black Lead.

BY DR. L. LANSZWEERT.

MESSEURS. EDITORS:—As much has been said, of late, about gold, silver, etc., I have thought it might not be out of place to call the attention of your readers to some facts with regard to the mineral whose synonyms are placed at the head of this article—giving a brief detail of the constitution, properties, methods of application and economical values of this remarkable substance. Especially may this be appropriate at the present time, from the fact that a great abundance of this mineral (and that of a very good quality) is being found in various localities on this coast, for which, as yet, we have found no application; although we are constantly importing the manufactured article in large quantities. This surely ought not to be. It should be the study of Californians to convert, so far as practicable, into useful products, all the crude material found within their borders.

## THE CHEMICAL CONSTITUTION OF GRAPHITE.

Graphite, plumbago and black lead, are so many synonyms for one and the same mineral. It was formerly supposed that graphite was a carburet of iron; but according to Berselius and other chemists, it is a peculiar form of carbon, and the foreign substances which it contains are held in a state of mechanical mixture merely, and not in chemical combination. It occurs both crystallized and massive, but chiefly in irregular nodules, and is found in various parts of the world. That found at Borrowdale, in Cumberland, England, is of the best quality yet found native, and is chiefly employed in the manufacture of lead pencils. The Siberian plumbago differs considerably from that found in Borrowdale, inasmuch as it is almost impossible to erase the marks made by it on paper, by the use of india-rubber. That which is imported from the East Indies is remarkably soft. That employed in the manufacture of crucibles, for anti-friction purposes, for protecting iron from rust, for stove polish, etc., is of the more common and impure varieties. About the same quality of this substance is also employed for glazing gun and mining powder, and for electrical conductors.

## RELATION OF GRAPHITE TO THE DIAMOND AND CHARCOAL.

The density and molecular structure of graphite places it between the two principal forms of carbon—the diamond and charcoal; the density of the former being 3.55; that of the latter 1.57, while that of graphite is 2.27.

The diamond is always crystallized—charcoal always amorphous. Graphite is ordinarily crystallized and foliated, but sometimes amorphous. The fundamental identity of the diamond, graphite and charcoal, or amorphous carbon, has been fully demonstrated by the analogy of their products when subjected to combustion in oxygen. Although very different in appearance, and, considering only their more or less facility of combustion, they yield both the oxygenaceous compounds—i. e. oxide of carbon or carbonic acid, according to the quantity of oxygen furnished them.

The remarkable differences in the physical properties of these substances, which are essentially identical in nature, constitutes one of the most curious facts in chemistry. *Diamond* is believed to be the hardest substance in nature; it is transparent, extremely refractive, and a non-conductor of electricity. *Charcoal*, even in its hardest form, is comparatively fragile, friable and directly opposite to the diamond in its relations to light and electricity—intercepting completely the first, and conducting readily the latter. *Graphite*, like charcoal, differs from the diamond in its lack of hardness, its friability, opacity, and conducting power for electricity. Notwithstanding this partial analogy between graphite and charcoal, the former differs materially from the latter in its greasy feeling, metallic luster and peculiar dark, steel-gray color.

The strong line of demarkation between the diamond and graphite, on one side, and graphite and charcoal on the other, are lessened or effaced in certain substances presenting characteristics intermediate between the two. Thus, notwithstanding however great may be the distance which separates the normal diamond from graphite, that distance is far more less appreciable, when we compare the less pure varieties of diamond with the more pure specimens of graphite. For instance, we find diamonds of a dark gray, semi-opaque, without luster, and giving, when burnt, 0.05 to 0.15 of ashes. (Dumas & Stass, Erdmann & Marchand.) The purest graphite leaves only 0.33 of ashes, (Fuchs) and sometimes assumes an hexagonal crystallization, as found in some specimens at Bayeros, in Brazil, and which,

according to Karsten, gives them the appearance of diamonds, in a certain state of degradation. Deposits of native graphite have been found in New Brunswick, and other localities, which, by character and aspect, resemble anthracite, and show, very imperfectly, the metallic luster and characteristic color of normal graphite! We sometimes find similar deposits of carbon in the form of scales, in the interior of gas retorts, which present the intermediate characteristics between graphite and amorphous mineral coal.

The existence of these bodies, which serve as transition between diamond and graphite, and between the latter and charcoal, taken in connection with the fact that they can be converted into a common product—carbonic acid gas—has naturally led chemists to ask the following questions:

Is it not possible to convert, reciprocally, these substances, the one into the other?

Cannot amorphous charcoal be artificially transformed into graphite, or converted into diamond?

The solution of the above questions has been affirmatively resolved as to graphite; but negatively, till now, as to diamond.

[To be Continued.]

[Written for the Mining and Scientific Press.]

## Earthquake Phenomena.

The most impressive phenomenon of an earthquake is the vibration, rising and falling, or wave-like movement of the surface of the earth, which may be felt over a surface more or less extensive. From this vibration comes the name—Earthquake. Writers, not a few, have conjectured the cause, but no one has yet, so far as we know, furnished a solution entirely satisfactory, nor do we assume to do so at present; but having some sympathy with the almost universal interest felt in the subject, we subjoin a few loose thoughts which have crossed our mind since the last "shake" that visited our city. We read statements that some earthquakes are preceded, and that others are accompanied by a low rumbling sound, like distant thunder; others are preceded by excessive heat and an oppressive state of the atmosphere. All are attended, more or less, by exhibitions of electricity. Now, if we can find a cause sufficiently powerful to produce the movement of the earth, we shall have no difficulty in accounting for the concomitants, sound, heat, and electricity.

There are reasons for believing that the causes of earthquakes may be much less powerful than is generally supposed. As already remarked, earthquakes are vibrations of the surface of the earth, either in a vertical or horizontal plane, or possibly, sometimes, a combination of both these movements. Allow us to cite a few examples to show that, under favorable conditions, either of these vibrations may be easily produced with a comparatively small expenditure of power. A stone weighing a few pounds, or even a few ounces, thrown into a smooth and quiet pond, or small lake, will send waves—vibrations—from center to circumference. A small dog, trotting over a long bridge, gives vibration to the whole structure, although it may weigh hundreds of tons. A blow given by a strong man with the head of an ax on one of the "big trees" of Calaveras, will make it vibrate to the topmost branch. A water-cart, or even an apple-cart, driven over the cobble-stone streets of San Francisco, will give vibrations felt in every brick house on both sides of the street, and how much farther we cannot tell; but we doubt whether the altitude of a star could be taken with an artificial horizon of mercury on the top of Clay street hill, while a heavy load was being driven along either Kearny or Stockton, from California to Jackson streets.

Herein is seen the wisdom of the City Fathers (so little appreciated by the vulgar), in adhering to cobble-stone pavements. To say nothing of keeping up the demand for horses, by this means they keep the people so educated to sham earthquakes, that a real one, unless it shake too hard, will be scarcely noticed.

There is one other species of vibration which ought to be mentioned—that of a long rope or wire, or even a long bar of iron. Let a long rope be strained ever so taut, and with the top of a pencil or a snap of a finger, one can send a vibration the whole length of it, which will speedily return to him. The shifting backstay of a ship, over an inch in diameter, and over a hundred feet in length, gives a good opportunity for the experiment. Any one who will take the pains to try this, will see that it illustrates the earthquakes of San Francisco with a good degree of correspondence. If the rope be drawn taut on the surface of still water, and both ends firmly fastened, the illustration will still more nearly correspond to the phenomena of an earthquake, for the resistance and friction of the water will bring

the rope more speedily to a state of rest, and the return vibrations will be much less numerous.

Fortunately for us, the earth, upon which our houses are built, does not possess the property of vibration to so great a degree as is exhibited in any of the instances above named; but still it has that property in a much greater degree than many suppose. All its pores and cavities are filled with either air or water, or some elastic gas, and either of these will transmit motion to a long distance. Of this fact there are numerous examples.

In the State of Illinois there is a spot called the "Shaking Prairie," so named from the fact that by jumping on the ground, vibrations of the surface extending many rods can be easily produced—in fact, an earthquake in miniature. In this case, doubtless, there is only a thin stratum of soil and turf over a substratum of soft mud and water. We have been in swampy places covered with a thick growth of timber, where, by jumping on the outspreading roots of a tree, one could set all the trees in sight to vibrating. Here, again, on a small scale, were all the essentials of an earthquake.

From the foregoing facts it will be seen that if the proper conditions are supplied, an earthquake may be inaugurated without any terribly great or powerful producing cause. If the Mammoth Cave of Kentucky were filled with water, as it naturally would be if below the sea level, a few pounds of powder or any other explosive material let off in its center, would make an earthquake as extensive, certainly, as the surface of the cave. It is only required that a small portion of the upper stratum of the earth be raised (gradually it may be), and allowed suddenly to fall back, or that a fissure be opened between two strata of rock, and permitted to close again at once, in order to set things in violent motion. In the former case the wave of vibration would naturally radiate from the point of upheaval as a center, and gradually diminish and die out in the distance. In the latter instance we should expect the wave at right angles to the strike, or antinodal axis of the strata. We know of but two means by which such movement and sudden recoil could be effected: First, the explosion, or gradual formation and sudden escape of gases, generated by chemical agency; or, second, the explosion of steam, formed deep in the earth and heated by chemical action, until its tension was sufficient to burst the rocky boiler and open a passage for itself to cooler quarters, where it would instantly condense and allow the rocks and earth to fall back to their original position. It is not necessary that the gases or steam should be generated suddenly. The process of generation may go on for a long period in deep subterranean caves, before they accumulate the power requisite to produce an earthquake by their own instantaneous liberation.

No doubt gases arising from chemical changes, deep in the earth, often escape gradually, to some extent, before the quantity is sufficient to effect any thing of consequence, and it is from this that the "premonitions" arise which sometimes pass away without being followed by a catastrophe. The rumbling sounds sometimes heard in the vicinity of volcanoes may be produced by electric discharges, the same as thunder; but they are more likely the result of the explosion of gases, in small quantities, issuing from a crevice in the vicinity of a subterranean fire, to which the air has access, and with which air the gases commingle and then explode. In this manner, doubtless, the power that would have produced an earthquake, if all expended at once, is sometimes let off gradually and harmlessly, so that only premonitions are given, without being followed by the dreaded sequence.

From the rapid increase of the tension of steam at high temperatures, we are led to think that at about 1,500° it would be sufficient to raise the crust of the earth about half a mile in depth. Much, of course, would depend upon whether the superimposed strata were clay, sand or rock, so that no general exact data can be given.

Few persons who have not studied the subject carefully have any correct idea of the immense power of heat communicated to water under confinement. One pound of water raised through one degree of Fahrenheit, gives a mechanical equivalent of one pound weight, raised through 772 feet, or 772 pounds raised one foot high. The consumption of one pound of coal will raise the temperature of 13,000 pounds of water through one degree, from which it will be seen that the heat generated by the combustion of one pound of coal, if communicated to water, would exert a lifting power sufficient to raise over ten millions of pounds one foot high.

One pound of hydrogen gas combining with eight pounds of oxygen to form water,

develops heat sufficient to raise over thirty-two millions of pounds one foot high. These data drawn from actual experiments, carefully conducted, give us an idea sufficient for our present purpose of the tremendous power in Nature's laboratory. We might go farther, by way of conjecture, to show precisely how earthquakes are produced, and even give directions for getting up one artificially, but we forbear, lest some college students should take the hint, and on some dark night shake us all out of our quiet slumbers for their own amusement.

By a reference to well established principles, we can easily account for any exhibitions of heat or electricity that may accompany an earthquake. Motion, like matter, is indestructible. Matter may undergo a thousand transformations, and in many of them become invisible to the eye, and yet lose none of its essentials. So motion may take various forms and still retain, potentially, its original energy. Sound, like heat and electricity, are merely modifications of motion. If a moving body be brought to a state of rest, all that part of its motion which is not, in some form, transferred to some other body, will be converted into either sound, light, heat or electricity, either of which, according to the circumstances, may preponderate and become more clearly manifest. Again, under proper conditions, light, heat, and electricity are capable of conversion or transformation, the one into the other. If two ivory balls be suspended side by side, and then one of them drawn aside and let fall against the other, we get a good illustration for our purpose. If the balls weigh each one pound, and one be raised one foot high, it will then have a "one-foot pound of power" at its disposal, and should be able to knock the other ball a foot high. But it cannot do this, for, in falling, it moves the air out of its path, and to effect this it expends the first portion of its power; then, upon striking the other ball, it makes a noise which reports a second portion of power expended; again, by impact, heat is developed which uses up a third fraction of force, and whether electricity is developed or not, we cannot say with certainty, but suspect there is, and if so, that would dissipate a fourth fraction of the "one-foot pound," leaving the remainder to be transferred, as motion, to the second ball, provided both balls were perfectly elastic; but if any permanent change were effected in the balls by the concussion, then another portion of force would be consumed equivalent to it, and less still transferred, as motion, to the second ball, which will not rise so high as the first was carried, before it will return and repeat the operations of the first on a diminished scale, and thus each, alternately, will operate until the "one-foot pound of power" which was communicated to the first ball by the hand has been all expended upon the air, or transformed into sound, heat or electricity, after which the ball will come to a state of rest. This illustration shows what is essentially true in every case where matter in motion is brought to a state of rest. Pure water is of such a nature, that by moving upon itself only, it produces very little of either sound, light, heat or electricity, consequently its waves run for a long distance until they find some other body upon which to expend their energies and divest themselves of the power that put them in motion.

A few years since, a wave started by an earthquake from Simoda, Japan, traveled across the Pacific, and expended its power along the western coast of America. Much of its power had, doubtless, been expended upon the intervening islands and inequalities of the ocean bed, as well as in the friction of the water upon itself for some five thousand miles; but still, after making these deductions, it retained power sufficient to report itself and make known by its presence that something unusual had somewhere occurred.

Earthquake shocks do not often travel to places distant from their origin, nor do they continue for a long period, simply because the friction produced in the earth by the grinding of its solid materials upon each other transmutates the moving power, as motion, into power, as heat, sound and electricity. An earthquake, once inaugurated, can subside only by effecting permanent changes in the earth itself, or by thus transmutating the moving power.

That portion of the power which is transformed to heat is seldom observed, for, if compared with the heat of the sun, its quantity would be insignificant; but the electricity being unusual, is more noticeable. It often precedes the shock of an earthquake, because the electricity, developed by the first shock at the origin, will be felt instantly at a long distance, while the shock itself, or rather vibration or wave, takes time to travel and transmit itself in the solid material of the earth.

D. V.

## Mechanical.

## A New Superheating Apparatus.

We have more than once alluded to the difficulties attendant upon regulating the heat of superheated steam, as constituting one of the chief obstructions in the way of a practical application of that agent. It is no doubt the grand difficulty in the way of the introduction of Danforth's, or any other similar steam generator. The hindrances in the way of employing steam at a temperature exceeding 350° Fah., in fact, never can be overcome until we can make joints steam-tight, without oil or any other than perfectly clean metallic packing. Every engineer knows, that if steam, of a higher temperature than that above indicated, is allowed to enter a cylinder, the cylinder immediately becomes perfectly dry, the oil is decomposed so as to become absolutely useless as a lubricator, friction is induced and the piston-head begins to cut out the cylinder. There is no way to get round this as long as it is made a necessity to use steam at such a high temperature. Engineers have endeavored to so regulate the temperature of the superheated steam as to keep it below the destructive figure mentioned; but hitherto without avail, unless the recently devised apparatus of Mr. Wyatt Reid, a consulting engineer at 104 Pearl street, New York, has accomplished the desired end.

The *American Artisan* of January 2d, gives an illustrated description of Mr. Reid's device, which may be substantially described as follows: Suppose a boiler set in the usual manner; in the chimney flue, just where the flames leave the boiler, set a small cylinder, pierced with tubes, placed and secured like those in a tubular boiler—this is the superheater. Now make two connections between this and the boiler—the upper one with the steam chamber of the boiler; the lower one with any suitable coil of pipe placed below the water level in the boiler. Let the opposite end of this coil of pipe pass through the walls of the boiler into the steam chest.

Now, when steam is raised in the boiler, it will pass through the steam-connecting pipe into the superheater, where it takes up the waste heat of the flue, and becomes superheated. It then passes from the superheater through the coil placed within the bottom of the boiler, where it will part with its excess of heat, by radiation, through the walls of the pipe into the water—thus utilizing the waste heat of the furnace. The steam will finally present itself at the steam-chest, at the temperature due to the pressure only, and not at a destructively high and unknown temperature, as has hitherto been the case in the use of superheated steam.

According to the *Artisan*, tests made with this apparatus show a saving of thirteen per cent. in fuel. And as the steam never leaves the pipe and heater after entering them until it enters the cylinder, all the advantages of dry steam is gained, without a destructive superheating.

This arrangement may be attached to almost any boiler; or if it is not convenient to attach to the regular boiler, a small extra one may be added, with a coil, to extract the superheat. The invention has all the appearance of being a useful one. We shall watch it and report progress.

**STRENGTH OF IRON UNDER DIFFERENT CONDITIONS.**—During some experiments made by the United States Board of Ordnance, under the direction of Major Wade, it was ascertained that a gun, burst with hydrostatic pressure, showed only about one-third of the strength exhibited under direct tensile strain in a testing machine. Among many similar results, a gun burst with a pressure of 9,000 pounds per square inch of resisting metal, whereas a sample bar of the same iron bore 27,350 pounds per square inch before breaking.

The minimum pull on the trigger, in discharging an Enfield rifle, is six pounds.

**THE BREAKAGE OF STEAMBOAT SHAFTS, ETC.**—A recent article in the *Scientific American* professes to find the cause of the frequent breakage of the shafts and cranks of ocean steamers, in the fact that they are generally made of scrap iron. The article concludes as follows: "From the examination we have given this subject, we are of the opinion that the only reliable and safe course for our forge-masters to pursue, is to make their forging of one kind of iron. Let them test the various brands of foreign and American irons, and use only the strongest and most tenacious that can be procured; and we feel confident that we shall hear no more of broken steamer shafts, endangering a loss of life and property." A Western exchange, in noticing this article, claims for the Lake Superior iron the superiority—evil to him who evilly thinks this a pun—over all other brands in strength and tenacity. It says: "We have seen with our own eyes an inch square bar of Lake Superior iron bent double and hammered down at the bend, when perfectly cold, without even presenting a fibrous or abraded appearance, but drawing perfectly smooth and as bright as polished tin over the curve. We have also seen an inch-and-a-half round bar, having a solid head forged on each end, drawn out by a tractile force like a stick of soft wax, until it was about an inch in diameter in the center, without a sign of parting, or the tearing of any fibers, or the appearance known as 'brooming,' but the portion drawn out remained smooth and became as bright as a mirror." The common impression that this iron is too soft for use as shafting, we are assured, is quite unfounded. Though tenacious and ductile, it is not extremely flexible, and can be tempered to a great rigidity. The subject is certainly worth the attention of forge-masters, and scientific men generally will be interested in its discussion.

**PLASTIC SLATE ROOFING, FIRE-PROOF.** The American Institute of New York speaks very highly of the recently introduced "plastic slate roofing," to which frequent allusion has been made in this paper. A sample of this roofing was recently exhibited to the Institute by J. M. Allen, of New York, one of the officers of the company, to prove that it was fire-proof. It was taken from a building which had been burned. In presenting it, Mr. Allen said:

"You will perceive it is neither consumed, charred, nor weakened. It was a soft mastic when the building took fire. Now it is solid, strong and thoroughly petrified. The roof was upon a wooden lean-to against a brick building. It was so perfectly fire-proof, and so tightly joined to the brick, that it prevented the smoke rising to blacken the wall above the junction. The superheated steam and air could find no egress. The room was filled with most inflammable material, yet with all the fire and heat none could escape through the roof. It hardened and stood until all support was burned away; when it fell it broke into large sheets several feet square. The owner of the adjoining building said it held the fire in, so tight, as to force it through a small hole into the brick building.

"This burning has therefore proved plastic slate, fire-proof. You will perceive, however, that the heat created gas in the soft substance, which made it somewhat cellular, though hard and strong when cold. If the supports of the roof had been of iron, the slate would have remained and formed a roof after the boards were burned away. This fire has proved that if wood floors were coated on the under side with plastic slate, it would prevent fire from getting up through them. We are now satisfied that we can make felt so stuffed with slate that it can be used as a perfect fire-proof screen, either for roofs or for any other situation."

**EFFECT OF THE ATMOSPHERE ON LONG PROJECTILES.**—Sir W. Armstrong has declared that, at low elevations, a long projectile, fired from a rifled gun, attains a greater range in a resisting atmosphere than in *vacuo*. The increased range he attributes to the buoyant property of the air. It is contended by some experimenters that the resistance of the air to a spherical shot is due to the whole disk of the shot projected as a flat surface against the air, while others insist that the resistance of a sphere, in such a case, is only one-half that of a flat-fronted shot of the same diameter.

**CAST-IRON GUNS**, cast from the same metal, have been found to withstand harder service when kept for a few years, or even a few months, before testing, than when fired while new.

## Scientific Miscellany.

## The Forest Trees of Australia--Valuable Oils.

There are about 120 known and determined species of forest trees in Australia; but among them all there is not a single member of the pine family. Pine, for inside finish for houses, etc., is chiefly imported from Oregon. One of the most valuable species of the forest trees of Australia is known as the gum tree, *eucalypti*, of which there are quite a number of varieties; some of which attain the extraordinary height of 300 feet. The gum or oil, and bark of this tree is very valuable; the latter for fencing stuff. The wood of the tree is not of much value.

One variety of this tree, the *eucalyptus amygdales*, yields large quantities of an essential oil, which, when its properties become more fully known, will no doubt prove of much commercial importance. It is said that 130 pounds of freshly gathered leaves from this tree, with the little branchlets to which they are attached, yields upwards of three pints of oil. The oil is a thin, transparent, yellow fluid, having a pungent odor something like the oil of lemon, but coarser and stronger; its taste is mild and cooling, producing an after sensation in the mouth resembling that of camphor. Its specific gravity at 60° F. is 0.881; its boiling point 300°. It is somewhat less volatile than turpentine. Like other essential oils, it leaves no stain on paper. It absorbs oxygen quite freely when properly exposed; producing thereby a residual resinous matter.

When brought in contact with iodine, at a slight increase of temperature, a dark-colored solution is produced, which, when heated, emits a peculiarly variegated vapor, in which the yellow, red, violet, green and blue colors are beautifully visible, especially in the sun light.

The oil is soluble in turpentine, in fat, and drying oils, in benzine, naphtha, ether, chloroform and absolute alcohol. It dissolves camphor, resin, gum Damara, copal, shellac, caoutchouc; but gutta percha, though digested in it for several days, remains unaltered. This oil may be considered the type of about twenty oils from Australian forest leaves, which are suitable for general application in the arts. Their properties would, no doubt, form an interesting and profitable study for the chemist. The trees bearing leaves from which essential oils may be extracted, constitute the great bulk of Australian forest vegetation. The oil of the one described above, exists ready formed in the leaves; the cells of which containing it may be seen in great numbers on holding them up to the sun or any other bright light.

COUNT RUMFORD has shown that all inflammable bodies may be extinguished by cooling agency. Even the explosion of gunpowder may be thus arrested, and its incipient inflammation extinguished by directing on it a strong blast of air. The force of the explosion of gunpowder is greatly increased when the powder is previously heated nearly to its point of decomposition. This may partially account for the bursting of guns after long firing. If fulminating mercury be laid upon a heavy block of iron and exploded, it will indent the iron. When exploded upon a thin plate of iron, like a fire shovel, for instance, it will often make an opening quite through it.

**WHITE LEAD AND SALTPETER.**—Clarence Delafeld, of Staten Island, has patented a process for manufacturing carbonate of lead. He claims his product is whiter and purer than can be produced by the old Dutch process. It consists in mixing a hot solution of nitrate of lead with a hot solution of carbonate of potash, and passing into the mixture superheated steam, which, it is claimed, prevents the formation of hydrated oxide of lead, and by this peculiar manipulation the whole is changed to carbonate of lead. After the salts of lead have been precipitated, the remaining solution of nitrate of potash is drawn off and evaporated, thus leaving very pure crystals of saltpeter.

**CONDENSING FRUIT—A NEW PRODUCT.**—This is a new method of preparing fruit, devised by a Mr. Borden; whether patented or not, we do not know. The juice of any kind of fruit which has been extracted, as for cider or wine, is immediately put into an air-tight condenser and boiled, by steam *in vacuo*. No sugar need be added. When the water of the juice is evaporated, and the residual substance cooled, it constitutes a perfect jelly, having the flavor of the original fruit, without any cooked taste. It is a business that cannot be conducted upon a very small scale; but a manufactory might be established in any extensive fruit growing neighborhood, greatly to the advantage, we should suppose, of both the grower and manufacturer.

The product must certainly be most palatable and desirable, as will readily occur to any one who will carefully consider the process. The great objection to jellies, etc., as ordinarily made, is the fact that the flavor of the fruit is destroyed by sugar and heat. Evaporation *in vacuo* allows the boiling to be done at a temperature much below the ordinary boiling point. Would it not be well for some of our large fruit growers in the neighborhood of San Jose, to look into this matter. We will volunteer to obtain all needed information for any party who may feel inclined to go into the operation. The chief machinery requisite would be a small steam generator and a suitable evaporating pan, similar to those used by sugar refineries.

The ignition of powder by the electric spark is greatly facilitated by mixing with the powder, in contact with the poles of the battery, a small quantity of chloride of potash and sulphide of antimony—composed of two parts of the former to one part of the latter. The smallest spark of induced electricity is sufficient to ignite such a mixture.

**LIGHTNING ROD PROTECTION.**—In the late proceedings of the American Institute of New York, a prominent member remarked that we frequently see published positive statements of buildings being struck with lightning and consumed, which were provided with lightning rods. The lightning rod theorists say it is because they were not perfectly adjusted. We say we do not believe any one was ever adjusted so as to be able to draw the lightning ten feet out of its course and carry it safely to the earth. They do conduct electricity; they do not, in our opinion, conduct what are called thunderbolts. If any one can devise a proper method of settling this question, we should be extremely glad to publish the truth for the benefit of our readers. We are ready to yield to facts, but cannot give up reason for theory, however old it may be.

**FOOD FOR PLANTS.**—A distinguished Russian chemist gives the following receipt, as affording one of the best preparations as a food for plants: Take ground bones, 40 parts; wood ashes, 40 parts; newly made lime, 6 parts, and wet with water enough to thoroughly mix the whole.

**MODEL ENGINE.**—H. J. Pepper, of Stockton, has made, says the *Independent*, a very beautiful and perfect miniature steam engine. The engine stroke is 1½ inch and three-eighths of an inch bore. The boiler is upright, made of copper, and holds a little more than a gill of water. The balance wheel is four or five inches in diameter. Steam can, by a spirit lamp, be generated in about four minutes, so as to supply sufficient motion to drive a sewing machine. The machine, including smoke stack, stands about eight inches high, and the whole will probably weigh eight or nine pounds.

**OIL.**—Most of the oil companies in Venango county, Pennsylvania, the great center of oildom, have been sold out at sheriff's sale. A few men, who were "cute," sold out early and made money; but most of those who became suddenly rich "in oil" are no better off than when they commenced. The business is now being conducted in more legitimate style than before, and is probably be, when systematized, a safe and lucrative pursuit.

## New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to Inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

The device for picking cotton by machinery, recently invented and tried upon the grounds of Dr. Thomas, near Memphis, is described as follows by the *Appeal*:

The machine is based on the wagon principle, having two wheels which move the machinery, consisting of two cylinders of brushes in the front, one at the back, and a cylinder of fine teeth in the center, with a receptacle at the back holding from 300 to 400 pounds of the cotton with the seed as picked. The machine is made to take two rows, the animal pulling it passing between the rows, and the driver seated high above the entire works. We saw the machine work, and though we discovered it still lacked many qualities which will have to be added, we feel sure it will in time be a success, and yet crown the inventor with glory.

**IMPROVEMENT IN HORSE-SHOEING.**—A new invention is now coming extensively into use in Boston, which bids fair to be of great use to tender-footed horses. It is also said to be such a relief to all horses working upon pavements that the city railroads of Boston are adopting the improvement extensively. It is a cushion of india-rubber placed between the shoe and hoof, both cushion and shoe being fastened by the same nails. It is said to be not only a preventive of dirt and gravel getting under the shoe, but entirely prevents horses from baulking, and that the shoes will hold on firmer and longer with than without the cushion.

**A MINING INVENTION.**—The Stockton *In.* dependent alludes to and describes a late mining invention as follows:

E. R. Chapin, of Sonora, has recently invented a very ingenious contrivance for saving gold lost from quartz mills, and which he terms a "Concentrator and Separator." The model which he intends to send on to Washington, in hopes of getting out a patent for his invention, could easily be placed in a person's coat pocket. It is entirely different from any separator or concentrator that we have seen used by quartz miners. A shallow pan, called the separator, elevated an inch above the concentrator, first receives the water sediment, quicksilver and gold escaping from the mill above. The bottom of the separator being deeper than the sides or mouth where the water flows over, the quicksilver and gold naturally settles down, while the light sands and sulphurets flow over with the water into the concentrator, which looks somewhat in shape like the shallow top of a soup tureen. Small holes are perforated in the bottom of this concentrator, through which the sulphurets pass into small pans fastened beneath, while everything flows over the top into the concentrator, which convey it away. The whole machine is suspended on four stout wires, each fastened at the bottom in a strong framework. Diminutive cog-wheels attached to a cylinder, which is kept in motion by the action of the mill above, sets the machine in motion, and gives both the separator and concentrator the same motion as that of a child's cradle when rocked gently.

**A RAILWAY INVENTION.**—An invention has been provisionally specified by a London artisan, which consists in so connecting the bodies of railway carriages to the under frame-work, that, in case of a collision, the two will be separated by the breaking of a bolt. By this means, the shock which passengers receive is broken. The body of the carriage slides forward in grooves on the frame-work, and thus is much less likely to be demolished than if the check was more abrupt.

**BROWN'S FILTERING HEATER.**—Some mode for preventing incrustation for boilers, caused by lime and other impurities in water, has long been a desideratum. We have just witnessed a combined heater and filter at the San Francisco Foundry, intended to subserve this purpose. It may be made of either wood or iron, the water being conducted through a pipe the full length of the filter, thence returned through a trough—subjected in its passage to and fro to the action of exhausted steam. The amount of sediment deposited is the best evidence of its efficiency. Some of the advantages claimed for it may be found in the advertisement which appears to-day.

## List of Officers of Corporations and Mining Companies.

[PUBLISHED IN THE FIRST ISSUE OF EACH MONTH.]

(Below we give the date of recent meetings held in this city, and the names of officers chosen or appointed. Every bona-fide company is invited to send us the result of their election, to be thus put on record, gratuitously, with any other facts of general interest.)

**GOULD & CURRY G. & S. M. Co.**—Dec. 17. Trustees: Alpheus Bull, H. B. Williams, John O. Earl, A. Seligman, Lewis Cunningham, B. F. Sherwood, R. H. Pearson. President, Alpheus Bull; Secretary, David Bowie; Treasurer, Wm. C. Ralston; Superintendent, Louis Janin, Jr.

**KOLER BROS. S. M. Co.**—January 14. Trustees: Stephen Otis, B. L. Brandt, J. S. Pollack, W. Fishel, O. A. Chase, Dr. R. P. Chase, J. W. Felt, J. Naphtaly, Geo. J. S. Hyams. President, Stephen Otis; Secretary, R. Wegener; Treasurer, Geo. J. S. Hyams; Superintendent, W. V. Roberts.

**SIERRA NEVADA M. Co.**—January 14. Trustees: Thomas H. Holt, Robert Apple, Henry Cutcher, C. F. Fargo. President, T. H. Holt; Secretary, John M. Burnett; Superintendent, Robert Apple.

## RECENT INCORPORATIONS.

**PIONEER PETROLEUM REFINING Co.**—San Francisco. —Capital stock, \$50,000; 50 shares; \$1,000 per share. Trustees: Chas. Scott, David Hunter, Charles H. Wakelee. January 24.

**UNIVERSITY HOMESTEAD ASSOCIATION.**—Capital stock, \$120,000; 400 shares; \$315 per share. Trustees: George B. Taylor, L. L. Robinson, E. Thomas, D. D. Thomas, B. Lewis, H. A. Gorley.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

131. From R. O. Margery, of Boise City, Idaho—silver ore from the Morning Star mine, Owyhee. The specimen before us contains considerable blue carbonate of copper.

132. Calamine, a silicious oxide of zinc, in crystalline crusts, on lead ore. This specimen is from the Arizona Consolidated Mining Company's mine on the Carmel lode, Eureka district, Arizona Territory. The principal ore of this mine is an argenteiferous galena, which assays an average of \$83 to the ton in silver, and 60 per cent of lead.

**SUTRO TUNNEL.**—The Nevada Legislative Committee on Federal Relations, have reported on the "Joint Memorial and Resolutions, asking Government to aid in the construction of the Suto Tunnel," and recommend its passage. With it, and as a part of it, they submitted a long and elaborate report, the object of which is to show the importance of the proposed tunnel, as the means of largely increasing the world's stock of precious metals, and its consequent bearing upon the future of the United States, and the payment of the National debt.

"HIPPOGRAPHY," says the *Times*, "is making rapid progress in Paris." Divers other papers throughout the State, echo the same. Verily, this is a new kind of "writing!" Perhaps they mean hippography? There are in that city seven markets for the sale of horse flesh. Forty thousand pounds per week is disposed of, at from seven to nine cents per pound.

**GASTRONOMIC DELICACIES.**—Seven hundred and fifty thousand oysters are consumed daily in Paris, not to mention one hundred thousand snails. Frogs are at a discount of late.

**NEVADA.**—On the 23d January, the snow was from ten to thirty feet deep on the Summit of the Sierra, and rapidly increasing in depth.

**THE Oakland Last Factory** makes, it is said, a superior article to that imported. The laurel timber used is from Russian River.

Work has been resumed on the Buchanan Hollow copper mine, in Fresno county. The prospects are said to be good.

## WEEKLY STOCK CIRCULAR

Of Associated Brokers of the S. F. Stock and Exchange Board

SAN FRANCISCO, SATURDAY MORNING, February 2, 1867.

## CITY STOCKS.

During the week under review sales of the following shares were effected: California Steam Navigation Co. at 59½@60 ¾ cent.; S. F. Gas Co. at \$65 per share; Pacific Ins. Co. at \$158; Fireman's Fund, \$10.50, and National, \$77.

We call the attention of our readers to the following

*Annual Statement of the Insurance Companies of San Francisco for the year 1866:*

Remarks.	Will increase capital to \$1,000,000 Feb. 11.	44 ½ ct. quarterly, Jan. 15.	3 ½ ct. Jan. 15.
Disbursements in Dividends.	\$150,000 00	75,000 00	53,828 15
Amount of Risks written during 1866.	\$30,344,358 00	17,992,223 00	8,357,610 00
Amount of Risks in Force December 31st.	\$18,623,269 00	8,206,351 00	7,433,000 00
Total Disbursements.	\$178,253 05	247,227 15	183,151 35
Income.	\$571,079 91	341,048 63	215,044 02
Total Assets.	\$1,218,231 83	892,035 00	631,139 39
Amount Paid in to December 31st.	\$750,000 00	500,000 00	250,000 00
Capital Stock.	\$750,000 00	750,000 00	500,000 00
Name of Company.	Pacific.....	Union.....	Fireman's Fund.....
	Merchants' Mutual.....	Home Mutual.....	California.....
	San Francisco.....	Oakland.....	National.....
	Builders'.....	Totals.....	
	\$5,350,000 00	\$4,407,619 90	\$1,241,892 31

\* In United States securities. † Three months in operation.

## MINING, SHARE MARKET.

The depression incident to the market last week continued to prevail until Thursday, since which time a much better feeling has been exhibited, with a decided rally in nearly all stocks. The impassable condition of the roads leading to the mills still operates as a barrier to active operations, and large piles of ore have accumulated at many of the mines.

**HALE & NORCROSS**—remains in firm hands; no sales transpired since our last reference. Early in the week \$2,000 per foot was bid. No change to note in the condition of the mine. The average production of bullion per ton is fully as large as during the closing months of 1866.

**SAVAGE**—declined from previous quotations, early in the week, opening at \$1,785, steadily falling to \$1,590, then rallying to \$1,770, and closing yesterday at \$1,930. The ore taken from this mine during the week ending January 26th, amounted to 1,575 tons, valued at \$54,402, equal to \$35.17 per ton; previous week the yield was 1,745 tons, showing an assay value of \$61.812. This supply of 1,575 tons came from the following sections of the mine: fifth station, 113 tons; sixth, 355 tons; seventh, 410 tons, and from the Curtis shaft, 697 tons. All the information we can obtain regarding the present condition of this mine is very favorable, and in itself, it is thought, does not warrant the recent marked decline

of this stock. On account of the impossibility to clear the old dump from the accumulated ore during some three days of the week under review, not more than half the usual number of men were employed in the mine. The roads continue in a bad condition.

**CROWN POINT**—also receded from closing price of last week, selling at \$1,000, dropping to \$900, improving again to \$1,000 and \$1,050, and at the close \$1,100 is asked. The amount of ore taken from the mine during the week ending January 25th, was 754 tons; previous week, 871 tons. It is said that the south drift on the 400-foot level shows about three feet of good ore. The shaft from this level has attained a depth of 72 feet. This mine at present shows an average yield of 150 tons of ore per day.

**YELLOW JACKET**—has been quite active under a continued decline, opening at \$690@ \$707.50, then selling at \$630@ \$640, improving to \$672.50, receding to \$560, rallying to \$660, and closing yesterday at \$720. A recent telegram says "the mine looks about the same." At latest dates the mill had stopped running.

**GOULD & CURRY**—met with few sales at a considerable decline, opened at \$540@ \$535, declined to \$500@ \$475, then sold at \$510, and at the close obtained \$500. The ore product of this mine during the month of January amounted to about 3,200 tons, of which 2,500 tons were sent to the Gould & Curry mill, and none to outside reduction works. The bullion returns to the San Francisco office during the same period aggregate \$66,423. The 925-foot level, or 5th station, has been opened about 25 feet.

**CHOLLAR-POTOSI**—opened at \$214, receded to \$205, advanced to \$217, then sold at \$208, and closed at \$221. During the week ending Jan. 26th, 728 tons of ore were sent to custom mills. Fine ore is said to have been recently found under the Blue Wing station, which has been developed to a distance of some 15 feet. The main drift on the first station of the new level has gained a distance of 449 feet to the north. The stope in this drift is said to look well, having already been opened some 18 feet.

**EMPIRE**—sold at \$172.50, then at \$170, and at the close sold at \$172.50. The prospects and business of this company, we learn, continue flattering; the mine yielding an average of 80 to 100 tons of ore per day. Owing to the bad condition of the roads for the past 60 days, the company have not been able to reduce and sell more than half their usual average quantity. The consequent accumulation in their dumps is now over 5,000 tons—equal to three months' average consumption. The new shaft being sunk in connection with the Imperial company is now down 760 feet, and progressing at the rate of about two feet per day. It will soon be the deepest shaft (as it is the largest) in Washoe, and the main dependence of the Gold Hill mines.

**IMPERIAL**—exhibited the least fluctuation of any shares on the list, improving from \$150 to \$156, then selling at \$151@ \$150, closing yesterday at \$160. The three clean-ups of the present month produced about \$60,000 in bullion. This company have a large amount of ore at the Rock Point mill.

**OPHR**—receded from \$157.50 to 143, then sold at \$147, and closed at \$147.50. **BELCHER** fell from \$130 to \$115, and at the close sold at \$125. **CONFIDENCE** declined from \$37.50 to \$33, closing at \$34; and **BULLION** from \$31 to \$24, closing yesterday at \$26.50.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$815,336.

**COPPERSMITH WORK.**—**JAMES MACKEN**, the original coppersmith, having carried on his present business for the past fifteen years in this city, is, as usual, at the old stand, No. 226 Fremont street, near Folsom, busily engaged in turning out all kinds of coppersmith work. He pays particular attention to steamboat, sugar house and distillery work. Repairing promptly attended to.

**SUTRO TUNNEL.**—The Empire company has subscribed \$15,000 to the stock of this company.

## Mining Summary.

THE following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the Silver Mountain *Bulletin* of Jan. 19th: The Northwestern Company, who leased the mine of the Buckeye No. 1 for a term of six years from last April, have succeeded in getting all their stock taken, and will commence operations soon.

The Washington mill has been stopped for a week past, in order to clean up and get the Morning Star ore out of the way and everything in readiness for steady and permanent work on Washington ores. At the mine a competent force is at work in getting out ores, and about next week teams will commence hauling and the mill be set in motion. The ores look fine—assays on an average being from \$50 to \$100 per ton; and it is now thought can be got out in quantities sufficient to keep the mill running day and night.

Capt. Uznay will erect furnaces for the smelting of Morning Star ore. The ore can be worked by mill process, but not at a profit, and pay \$17.50 per ton for it and take it out of the mine. Guido Kustel came here last summer and made careful assays and estimates of the ores of that mine, with the view of taking a half interest in the contract with Capt. Uznay; but his estimates were that \$14 per ton would be an exorbitant price for the ore and take it out of the mine; and that \$17.50 per ton and mine it, would ruin the man who took the contract. If the Morning Star Company consult their interest, they will modify their contract with Uznay, so as to enable him to erect smelting furnaces, as until some profitable mode is discovered for working these ores, the mine is valueless to the stockholders.

A "brick," weighing seventeen ounces, from Morning Star ore, was presented to J. C. Ransom, Superintendent of the mine, and one of forty-two ounces to W. D. Root, the President of the Washington Company.

## Amador County.

From the *Ledger* of Jan. 26th: We are indebted to a friend for the following items from Pine Grove:

The Italian is again under the management of its old proprietors, McLaine and Sorrocco Bros. The mill is running night and day. . . . The Golden Eagle, Vaugh & Co., is yielding as largely as ever before. A ton of ore worked by Thoss, at his sulphuret works on Else Creek, as an experimental test, yielded \$312. Cost of working \$80. . . . The Union, is experimenting very successfully. Three tons of ore, such as pays in the old way \$4 or \$5, was made to pay \$50 per ton. . . . The Paugh mine and mill are going night and day, and the yield continues entirely satisfactory. . . . The Craft mine is now prospected by tunnel over 300 feet in length and some 175 feet in depth. The body of ore is large, varying in thickness of lode from five to fifteen feet. A lot of the ore worked by Ambler, at the Sutter Creek sulphuret mill, a short time since, paid over \$300 per ton. Craft has over 200 tons on hand, but no mill, and cannot get it worked. . . . The New Discovery, of which we spoke week before last, is now prospected twenty feet in depth, and looks more favorable than ever.

The Placer mines are not producing much. Daniel Fake & Co. have had to suspend work on account of water. . . . Lutell, Hawkins & Co.'s claims have paid unusually well this winter. . . . The Bradshaw's, J. F. and Sam., have a fine claim on Marshall Flat, and are said to be taking out lots of gold. . . . Billy Marshall is just getting his hydraulic claim into shape, and after nine years work thinks there is plenty of good ground in his claim to keep him going nine years longer. . . . Tom Cline struck a claim the other day on Marshall's Gulch, and panned out \$35 the first day.

## Calaveras County.

From the *Chronicle* of Jan. 26th: Notwithstanding the bad weather, Hoerchner, Myer & Co. have vigorously prosecuted labor on their claim near Middle Bar. They have run their tunnel a distance of one hundred feet, directly on the lead, and throughout its entire length the quartz prospects finely. The ledge is wide—varying from four to six feet—and the rock all contains gold. Paying quartz enough has been already uncovered to warrant the company in erecting a mill, and we confidently expect to see machinery in operation on their claim early in the Spring.

We were shown this week some fine specimens of gold-bearing quartz rock from the celebrated "Billy Shepherd" claim, near Whisky Slide. Gold was plainly discernible without the aid of a glass. The vein, at

the depth of thirty feet, has developed into a solid ledge of quartz four feet in width, between well-defined walls. It is estimated that the rock, unassorted, as it comes from the shaft, will pay \$20 per ton.

## El Dorado County.

From the *Courier* of January 26th: We saw, the other day, four or five very rich pieces of quartz from the Manning ledge. The specimens looked to be at least half gold, with a sprinkling of sulphurets, and it was estimated that a ton of such rock would be worth at least five thousand dollars. They are now down about 130 feet, and work is progressing finely.

Dickerhoff & Gowan, have concluded to erect a 10-stamp mill to crush the gravel taken from their tunnel on Cedar Hill. Two mills have recently been put up on Texas Hill, which promise to pay well.

A fine ledge of decomposed quartz was found a few days since by Mr. Clackley, while at work sluicing off surface on his lot, which pays ten cents to the pan.

Mitchell & Co., of the hydraulic claim on Little Spanish Hill, have a bed of cement thirty feet deep, upon which they intend to put up a mill.

Napier & Co's mine on Poverty Hill continues to show some remarkably rich prospects, and so soon as the weather becomes sufficiently settled they contemplate erecting an arastra, with a couple of stamps attached, with which they expect to be able to work about four tons of rock per day.

Placerville correspondence of Sacramento *Union*: In a ledge fifty feet in width, running through the old Buckeye claim, on Texas Hill, every pan from several places on the ledge prospects from five to fifteen cents to each pan. The owners, H. A. and W. Wright & Co., intend to put up an arastra immediately. The Long Island claims were purchased a few days since by French & Co., of Gold Hill, at \$2.50 per foot. Hall & Co., on the same ledge north, are getting fine rock. They intend to put an arastra on their claim immediately. Shepard & Co. have got ready to take out rock. One thousand dollars of coarse gold has been picked up from the dirt within the last four weeks. The cement mills on Smith's Flat are all paying good wages. At Brownsville, Tullock & Co. have made three runs on rock from the Independence ledge, which paid between thirty-five and fifty dollars per ton. The old Eagle claims at Grizzly Flat are paying better than they did ten years ago. A new 40-stamp mill will soon be completed on the old Steely ledge.

## Kern County.

From the *Havilah Courier* of Jan. 19th: The mining claims situated in the Cavo District, near Kernville, and formerly the property of the Caldwell and Kern River Gold and Silver Mining Company, and consisting of the Bull Run, the Beauregard, the Jeff. Davis, and several others, have changed hands, and are now the property of DeLand, Ellsworth and others. The Bull Run, now called the Sherman, has been worked for the last two years by A. Staples, Esq., and has proved to be a rich and reliable mine. It has been sunk upon to the depth of 225 feet, and the lead shows no diminution in size or richness. A large amount of rock has been worked upon the twelve-stamp mill of that company, situated on Kern river, about half a mile from the mine. The yield of gold from the mine has been very great.

The Big Blue and Sumner claims, in the Big Blue lode, are about to be worked by Mr. J. W. Wadleigh.

The crushing of the rock in the Mammoth Gold Mining Company's mill, has been temporarily suspended, for the reason that the mine is not yet in a condition to keep the mill fully supplied with quartz. The Mammoth has always been regarded as one of the richest lodes in this section. The vein will soon be opened at a deeper point than ever before.

The last shipment of bullion from the Long Tom mine was something over \$30,000, the result of five weeks' run. The recent storms have injured the mines to such an extent that the mill of the New York and Clear Creek Mining Company has been compelled to stop work, but soon will be going again.

## Mariposa County.

A letter from Coulterville to the Mariposa *Gazette* of Jan. 19th, has these items: Douglass, Chamberlin & Co., are working away with a full force on their mine. They have four shafts sunk, ranging in depth from thirty to one hundred and thirty feet, from all of which they are getting good rock. This company have reuted a portion of what is known as the "Old French mill"—have put in four of Wheeler & Randall's pans, and made other improvements. They are working twenty-two tons daily.

McCrew & Bell, on Black Creek, near town, have started their mill of five stamps.

Their rock is paying about \$30 per ton. Charles Hope, the superintendent of the old Goodwin mine, on the North Fork, is now getting out and crushing some very rich rock—he has crushed sixty tons and it yielded \$36 per ton. The Virginia, owned by Capt. J. M. Aiken, three miles from town, has been opened in six different places, and in every place it shows a large well-defined vein. There have been taken from the various places upon which work has been done about 200 tons of ore, which now lies at the mine, the largest portion of which shows gold.

From the *Mail* of Jan. 19th: All the employees on the Mariposa Estate have been discharged, and work at the mines and mills has been suspended and will remain so, it is thought, during the pendency of the suit between the company and Dodge brothers.

Letter to same from Horseshoe Bend, says: Mining is here carried on at present on an extensive scale. Some ten large hydraulic claims are in operation, besides drifting to a great extent, and as a class the miners are doing well. Among the most successful miners are John Lewis, Captain Notherwood and Frank Horbeck. Quartz mining here, just at present, is at a standstill. We have a fine 10-stamp mill, built by Mr. J. B. Briechnan, of Coulterville; but he failed to make it pay, from the want of capital to furnish the mill with a proper amalgamating apparatus.

## Nevada County.

From the *Transcript* of January 23d: At the Soggs mine, on Deer Creek, rock is being taken from both the upper and lower tunnels, under a contract to take out several thousand tons. We are told that the quartz is looking first-rate. On Monday night the dam above the mill gave way, and the mill had to be stopped for a time, but the damage was repaired yesterday. An 8-stamp mill is kept at work day and night upon the quartz taken from this mine.

Leeth & Co., and Craig & Co., of Deer Creek, have discontinued operations on account of high water.

Stiles' mill is being repaired, and will resume work in about ten days. Five new pans have just been completed for the Banner Mining company. They now have ten pans and two settlers.

From the Grass Valley *Union* of January 24th: The Utah company have struck a very handsome two-foot ledge in their claim. The rock is good looking, and it is estimated will yield about thirty dollars to the ton.

The Union Hill mine has been compelled to suspend operations temporarily on account of high water.

A fire occurred, says the *Gazette* of January 23d, in the tunnel of Buckman & Curran, near Little York, on Monday. Some parties at work were more or less injured.

The National says the Alison Ranch company are now having built fourteen of Norton's pans, to be put up and used by them to grind the tailings which have accumulated about their works for a number of years. It will probably take the company a year to exhaust their tailings, which are supposed to be very rich.

EXCELSIOR.—From the *Meadow Lake Sun* of Jan. 19th: The mines worked during the winter are progressing favorably. The U. S. Grant Co. are now down sixty feet on their ledge, and find as good, if not better rock than at the surface, and their mill continues to pound away all the time. The mill of the Golden Eagle Company is about complete, and before our next issue, will be running on rock from the mine of the company, every piece of which shows free gold. The mill of the Reduction Company is also nearly or quite finished, and is to be supplied with rock from the Comet Company, and also from other claims on the "Old Man" mountain. The Wintou mill has been thoroughly repaired, and is now ready for job or custom work. The Mohawk Co. are now running their third level or tunnel, and we understand that within a day or two past have let a favorable contract for its further progress. The California Company still works, and pounds and blasts away at their big shaft. Their mill is nearly ready.

## Plumas County.

From the *National* of Jan. 9th: The following items are from Mineral Township: The Plumas and Spanish Ditch has been greatly damaged by the late storms, and parties having property situated directly under the ditch have been greatly damaged by the flow of water. . . . Many miners who have been waiting for water in dry ravines, have been well supplied, and some in the neighborhood of Meadow Valley and Spanish Ranch are being well paid. . . . Many of the old diggings that have had tailings piled up for years, impeding the working of the same, have been cleared out effectually, and are now paying good wages.

From the Quincy *Union* of Jan. 19th: The storms, snow and rain, together with the cold weather, has put a pretty effectual stop to outside mining for the present. The owners of tunnel claims in different parts of the county are at work taking out pay grit, but they will have to wait for water before they can wash up.

The owners of the Clairmont Hill claims are still driving ahead with their tunnel, and the gravel improves as they advance in it.

## Placer County.

From the *Herald* of Jan. 26th: A majority of the owners of the Green Emigrant ledge have sold to Messrs. Lowry and McCarty, who have commenced work again on the claim. On Tuesday last they took out some very rich specimens from the old shaft.

Recently Welty's mill, near Ophir, crushed five tons of quartz from a lead near Gold Hill, which yielded six ounces, thirteen and a half pennyweights, worth about \$14 per ounce.

At a miner's meeting at Forest Hill on Jan. 20th, a "Miners' Protection League" was formed, the object of which is to discountenance the employment of Chinese laborers for mining claims.

From the *Stars and Stripes* of Jan. 23d: Col. Louis Hagan, of Sacramento, who has been extensively engaged in mining in this State and Nevada, has machinery on the way from San Francisco for a quartz mill to be erected near Ophir.

## Shasta County.

From the *Courier* of Jan. 19th: Work has been temporarily suspended on the Tornado claim, owing to the want of water in the Clear Creek ditch since the destruction of the Whisky Creek flume. The last clean up paid \$305.

## Sierra County.

An *Alta* correspondent says: The Keystone mine, located not far from the Buttes, is paying largely, and it is surprising to see how many equally as good, if not better veins in this county lay unprospected. Skillful labor, capital and energy is all that is required to make Sierra county one of the leading mining districts of California.

The *Alta* knows nothing of the rumor that the proprietors of the Sierra Buttes quartz mine have offered it for sale for \$575,000 to parties who are trying to effect a sale in New York.

## Trinity County.

From the *Journal* of Jan. 19th: We hear from Junction City that John Dacy has just struck very rich prospects in the upper bench, between the old Dacy claims and Fagan's claim. Prospectors have heretofore found as high as eighteen cents to the pan in this ditch, but no water could be had to work. McKinney & Co. have found richer ground in the second bench above Price's Bar, than that heretofore worked. Junction City is just now taking the lead of other districts in the county, which is accounted for from the fact that more prospecting is done than elsewhere.

Turner Bar Company's ditch to Smith's Flat has been thoroughly repaired, and the Smith ditch will be soon running water again. Cochran's ditch to Filibuster Flat will be ready for use a week hence.

All the damage done on Indian Creek by the December storm has been repaired. Every dam in the creek was carried away, and the fact that they have all been repaired and the ditches put in working condition in the short space of a month, speaks well for the enterprising miners of that district. The mountains at the head of Indian and Redding's creeks are covered with a great depth of snow, and the indications for a successful mining season was never better. About 150 men are employed in the Indian Creek mines at the present, and the number will be increased when the new diggings lately discovered are fairly opened.

## ARIZONA.

The *Alta* of January 23d, gives an extract from a letter dated "Big Bug District," December 3d, which we condense:

The first location of quartz mines in the Big Bug district was made in 1864. The Ticonderoga lode is considered the richest lode now opened and worked. It is near seven feet in width, and pays from fifteen to one hundred and twenty-five dollars per ton. This mine is owned by Colonel Woolsey. He is working a 5-stamp mill by water. The Dividend, Big Bug, and Galena lodes come next. They are owned by Berger & Co., who work the ores in a 10-stamp mill by steam. The ore pays from forty to seventy-five dollars per ton. They have turned out several respectable lumps of amalgam. So far, I think most of the metal taken from the mills here has been used to pay expenses and the debts of the company. Next we come to the Eugenie, Sinaloa, Sonoma, Green Tree, Bourbon, Napa, Orion, Richmond, Buncombe, Chaparral and others, all of which have been tested by work suffi-

ciently to prove their worth. Some of them have been worked with arrastras, and yielded an amount that would pay well with a mill. Of the wealth and permanency of these mines I have not the slightest doubt; but that, of course, remains to be proven. The great trouble here is, that most of the owners have not the means to go on and work these mines as they ought. The lodes are well defined, as a general thing, and easily traced. These leads are all within two miles of Big Bug Creek. The power for mills used on this stream must be steam, as there is not water sufficient the year around for any other. There is a good wagon road already made to these mines. It is twenty miles from here to Prescott, and about one hundred and seventy miles to Hardyville. There are three quartz mills now running in this district. It is six miles to Lynx Creek, and ten miles to Colonel Coffin's mill, on the Bully Bueno mine. The number of miners at present is about sixty, with a steady increase. The dark days of this part of Arizona have changed into light, and we are all looking forward to the bright future that is looming up before us. Even now, from the summit of nearly every hill in this range of mountains we can hear the merry clank of the stamps. The results of the crushing from the mills in the surrounding districts is equally good. There are several other mines in this district now opening, and mills erecting, all of which promise to pay well.

A letter from Prescott says: The Sterling lode, six miles from Prescott, worked by W. T. Flower, pays ninety dollars per ton. The small mill at the Vulture lode, Wickenburg, sixty miles south of Prescott, is doing finely, and the large mill will be ready early in February. At Williams' Fork, on the Colorado, the Planet and Eliza copper mines look better than ever. The furnaces of Knowles & Coffin were started on the first day of the year.

The Arizona Miner of December 29th says: We have it from one of our old and respected quartz mill men from Nevada, that Colonel Woolsey's mill at Agua Frio is now running very successfully and efficiently. The quartz is good and abundant—the mill in fine order and in good hands.

The large quartz mill of A. E. Noyes & Co. has arrived at the Umpqua mine, seven miles from Prescott.

#### BRITISH COLUMBIA.

Several parties have arrived lately in Walla Walla from the Kootenai country. They report that mining operations had been suspended for the winter. The work on the "big shaft," from which so much has been expected, had stopped, owing to the water-wheel freezing fast. The winter in the Kootenai country has been unusually mild, and miners were calculating upon an early spring.

#### COLORADO.

From the Times of January 8th: At James' Creek there are two or three hundred miners and prospectors hard at work—some preparing to put up mills in the spring, and others sinking on the veins.

The Smith & Parmelee Gold Company produced during the month of December 875 ounces of gold, running fifty-one stamps. Mr. Belden, the superintendent, says that had he not had some interruption, the amount would have exceeded nine hundred ounces.

Last week the foreman of Gunnell mill run a lot of Gunnell lode tailings through a Bartola pan, and realized one hundred ounces of amalgam, which retorted thirty ounces of gold.

Same of December 31st: The Anglo Saxon, a famous new silver lode lately opened near Georgetown, Clear Creek county, was purchased on Saturday last by Messrs. Eb. Smith and Fox Dieffendorf, two well-known moneyed men. The price paid was reported to us at fifty thousand, twenty-five thousand of it cash. Out of three pounds of the average ore, we saw a silver button worth \$4.05.

From the Denver Gazette of January 6th: In Ward district, the Ni-Wot company are making preparations to rebuild their mill, and have paid off their road hands. Cushman & Co's 10-stamp custom mill is running night and day, and the ore put through gives a rich average. The Long's Peak company are re-furnishing their mill. Crosby & Thompson are running their mill day and night on Stoughton ore with good results. Several companies are sinking on their lodes. Bixby is doing well with the old 6-stamp mill on Snicker ore. Ten thousand dollars cash has been offered and refused for claim No. 2, on the Columbia. Another very promising lode has been struck by a Mr. McMin.

#### IDAHO.

From the Owyhee Bullion of January 17th: The quartz mill of Carter & Co., in Flint district, is nearly completed, and will probably start inside of two weeks. The roasting furnaces, which are the only thing that can

delay them so long, are being rapidly built. It is the intention to work rock from the Rising Star mine.

The latest news from Salmon River, says the Montana Post of January 5th, confirms the previous reports as to its richness and extent. Some forty gulches have been discovered, and the miners are only awaiting the return of spring to prosecute their development. Parties who have gone over from this place, write back to their friends to stay here during the winter, as nothing is being or can be done at present, but encouraged them to come in the spring. Flour is worth twenty-three dollars per hundred in the mines.

#### MONTANA.

From the Post of Jan. 5th: Ira L. Phillips has several shafts sunk on his leads to a depth of fifty feet, and has a large force of hands employed in developing them still further. The crevices are increasing in richness in a most satisfactory manner, and a mill will be put up next season.

We erred somewhat in giving the returns of the last clean-up from Judge Turnley's mill. The net amount will be \$8,820.85, for one week's run, during which the mill crushed some eighty-five tons of rock.

Claims in Lost Horse Gulch, for the amount of work being done on them, are turning out exceedingly well, and all holders of ground are confident of having a good thing. We saw a prospect from two pans of dirt out of Perry & Co.'s claim which weighed \$9.50. The gold was coarse and much resembled that from Summit district in Alder Gulch. Quartz of surpassing richness is found in the surrounding hills. Two lodes were recently discovered which prospect equal to anything in the Territory.

At Highland, everything looks promising. There are some thirty or forty claims being worked by drifting, and competent judges estimate the weekly proceeds of these at \$30,000. The numerous gulches in the vicinity will be prospected as soon as the spring opens, and we expect to hear of rich discoveries. There is about four feet of snow on the range this side, and traveling is difficult.

Bannock letter to same, dated Dec. 25th, says: The new 24-stamp mill of Kirby & Clarke, Marysville, is not yet quite ready for crushing. The company has a large amount of quartz ready at the Mademoiselle lode. The Hopkins & Butterfield Company have sent east for better machinery. Col. N. E. Wood, is still sanguine of success with his crusher and amalgamators. The engine, which was furnished by the N. J. Company, proved a failure, being too small and deficient in power.

A letter from Virginia City to the Calaveras Chronicle, Jan. 4th, has the following: The placer mining in this country is confined exclusively to the gulches and small creeks, and they are scattered here and there in localities over a great extent of country, from a dozen to fifty miles apart—and frequently only one or two gulches will pay. There are no hill diggings here. Quartz throughout the Territory promises well. In every district where any trial has been made of the ledges they have been found to be rich, and greenbacks by the bushel are being sent here from New York and other Eastern cities, for their development. The most of the mills will be brought from California. Eastern mills, so far, in almost every instance have proved a complete failure. Possessing, as she does, ledges unsurpassed in number, richness and extent, with the best of mill sites in every direction, and plenty of fuel, the future prosperity and greatness of Montana, as a mining country, does not admit of a doubt.

#### MEXICO.

A Mazatlan letter to the Atla of Jan. 29th has the following: Mining companies are at work again at Cosala and the adjacent mines; and as it is now understood that the authorities will permit the shipment of bullion, we are looking forward to large exportations. A few shipments from our prominent mines here will awaken you Californians, and we shall soon have a large emigration of Americans, who will develop the riches of our mines, and prove that Mexico is still rich in silver.

#### NEVADA.

##### Black Rock.

The latest news from Black Rock is to the effect that the new mill made one run, but owing to the inferior quality of the salt used, they were unable to make a satisfactory test of the ore. The company have ordered a quantity of salt from Virginia City.

##### Esmeralda.

From the Union of Jan. 19th: "On last Saturday the remainder of a shipment of bullion (1,700 pounds in all) arrived in Aurora, en route from Hot Springs to the Bay. This bullion was from the smelting works

of Dr. Partz and from ore from the Cornucopia mine. The mine is in good order for getting out ore, and there is a great deal of good ore in sight. A number of miners have lately been employed, and it is the intention of the Superintendent to take out enough ore to keep the furnace constantly occupied. The mines in this section are, so far as we can learn, looking very well.

##### Humboldt.

From the Register of Jan. 19th: The North Star ledge has been struck in the shaft, and it looks handsomely. It is widening rapidly as depth is made, and on Wednesday had spread out to five feet. The samples of rock we saw we would think could be worked to yield near a hundred dollars the ton.

The workmen have struck the Agamemnon ledge, or a number of feeders—do not know which. Quartz, in strata, and containing a plenty of sulphurets and other silver ore. Will know more of it next week.

Mr. Davids, Superintendent of the Seminole Company, has started for New York, to confer with the company in regard to further operations. The tunnel is already in nearly half the distance to the first ledge.

Same has Oreana items as follows: The refining furnaces of the Oreana Smelting Works are all working to entire satisfaction. The shipments last week were 2,027 ozs.; value, \$2,400; previous week, about the same, and will do as well this week. The present cupelling furnace is small, but works well. Will catch up with the smelting furnaces by February 1st, when the entire works will be in operation again.

A new cupel and two more calcining furnaces will soon be added to the works.

A telegram from Unionville, Jan. 24th, is as follows: The American Basin Company, on the Sheba ledge, struck some very rich ore yesterday in their tunnel, which is in a distance of 780 feet.

##### Pahranaगत.

From the Territorial Enterprise of Jan. 24th: Mr. Sanderson, who left Pahranaगत about a week ago, reports the prospects as encouraging.

About five hundred miners are in the district, and the attention of Eastern capitalists is being attracted toward it. Mr. Raymond, who is operating for a New York company, has a five-stamp mill running on rock from the Illinois ledge. Owing to the refractory character of the ore, not above twenty per cent. of the assay value of the ore was saved in the first runs; but roasting furnaces have been erected and another run made, the proceeds of which were being cleaned up the day Mr. Sanderson left. Mr. Raymond informed him that the indications were that the new process would work the ore up to about ninety per cent., and, consequently, produce a result of from \$125 to \$175 per ton. Three steamers had arrived there during the season, and another was expected in a few days, which had on board the machinery for another mill.

##### Reese River.

From the Reveille of January 16th: Operations at Silver Bend are progressing favorably: The Combination company are now engaged in running tunnels to cut the ledge in their claim on the Highbridge; the first is intended to cut in 200 feet below the outcrop, and the second 100 feet below that. Colonel Buel's location on the Highbridge is yielding ore of an improved quality. It is opened by three inclines, which are connected by drifts. The greatest depth attained is sixty feet. The location of W. E. Leon on the El Dorado ledge is also being opened by an incline shaft. A small but very rich vein of mineral has been discovered about a mile north of Buel's mill at Belmont. It was named the Silver Cord, and its thin vein of ore, pronounced the richest yet exhibited in the district, has widened to eighteen inches at the depth of several feet.

From same of 17th: We saw to-day two bars of bullion from the works of the Social and Steptoe company at Eagan Cañon. The bullion is very fine and contains about six per cent of gold. This is the first lot of bullion received from that section for a long period, but hereafter it will produce regularly. We are informed that the bullion was obtained from the tailings of former working, which assayed from \$140 to \$160.

Same of 18th: Some 7,000 ounces of bullion were brought into town yesterday from the mill of the Twin River company. This is worth, at \$25 per ounce, about 8,750.

Same of 19th: Seven and a half tons of ore from the Buel North Star, of which Capt. Phillips is superintendent, just reduced at the Manhattan mill, yielded a bar of bullion valued at \$1,097.

We learn through a letter just received from Hot Creek, that the mill of the Consolidation company is doing well, and that a considerable amount of amalgam has accumulated.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Territorial Enterprise of Jan. 16th: The Canfield mine belongs to the Silver Bend Silver Mining Co., the stock of which is mostly held by Eastern capitalists. The company has a working capital of \$300,000 in coin to develop their mine and erect mills.

Same of 24th: A large proportion of the mills in this county have been obliged to suspend operations by reason of not being able to get the necessary ore to keep them running, on account of the terrific condition of the roads.

The Bullion Company are reported to have struck a fine body of ore at their lower level.

At the new shaft of the Imperial and Empire companies another installment of heavy machinery was received for the proposed new works, which will be of the most massive and powerful description.

Same of 25th: The old claim of McMeans & Williams, west of American Flat, was sold the 25th day of June, 1866, for debts, and purchased by Mr. Frank Baker. The company having failed to redeem, Dr. McMeans and Andrew Lawson, two of the original locators of the ground, purchased Baker's title to the whole, and are now at work again.

The Hale & Norcross Company have commenced a shaft of the largest dimensions, east of their present works. Through this shaft the mine will be worked to a very great depth. The top is 207 feet below the level of the top of their old shaft, and it will intersect the ledge at the perpendicular depth of 1,133 feet from the surface.

Same of 26th: The suit of Thomas Farrell against the Savage Co., for 600 feet of ground, is now brought in a new form in the U. S. District Court. A motion for an order granting a survey was argued and granted. There are several grave difficulties in the way of making a survey of the ground claimed, except at the surface, unless the Savage Company will allow their cages and machinery to be used for the purpose.

**BLASTING FUSE MANUFACTORY.**—A company has been formed in Grass Valley for the manufacture of fuse by a machine invented by James Eva, of that place. The capital stock has all been paid in to make a beginning. Mr. Eva is now in New York superintending the construction of his apparatus. The Grass Valley National of Jan. 19th, says:

"In all probability the first fuse manufactured will be in Grass Valley—being a central point from which the company will introduce it to all the mines in this county—at some future day. The principal place of manufacture will be at Santa Cruz, where powder, twine and paper is already being manufactured, and which are necessary to the manufacture of fuse. Mr. Eva has already manufactured fuse here with his model machine and given it to practical men for test, and the result has been highly flattering. His fuse will be somewhat different from that received here from the Atlantic States or England. The imported fuse is bound with tape, while Mr. Eva's is wove on the outside, making it almost impossible for the water to find its way to the powder."

We have already spoken of the necessity of such an institution in California. The importance of having fuse which is fresh from the manufactory, is well understood by those whose lives are dependent upon it. The severe tests to which the imported article is subjected to, in transportation through a variety of climates, makes it more or less unreliable. Measures have been taken to procure a patent through the MINING AND SCIENTIFIC PRESS.

**GOLD AND SILVER IN MINNESOTA.**—A Washington telegram, dated Jan. 26th, says the Commissioner of the General Land Office has received communications from St. Paul, Minnesota, stating that assays made of quartz rock found in Charleston county show the existence of both gold and silver veins, well defined. Work has been performed sufficient to show the locality rich in mineral.

**THE LARGEST CLOCK** in the world is that on the English Parliament House. The dials are twenty-two feet in diameter, and the pendulum is fifteen feet long.

## Mining and Scientific Press.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the MINING AND SCIENTIFIC PRESS in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.

## San Francisco:

Saturday Morning, Feb. 2, 1867.

Agency Notice.—S. D. Whittaker's agency for this paper has been revoked.

## Notices to Correspondent.

P. W., HUMBOLDT, NEVADA.—The most economical and judicious modes of proving an untried mine or lead have already been described in former numbers of this journal, in reply to various correspondents, for an account of which we must refer you to our back files. We have recently however, been informed of a singular mode of working mines practiced in Derbyshire, which may perhaps prove useful in cases like yours. We may premise our description, which is copied from *Farey's Derbyshire*, that the mode about to be described has been in use certainly from the date of the Roman occupation of Britain, and so far as climbing shafts are concerned, is, we are informed up to the present time, almost invariably adopted in the High Peak and adjacent lead districts. Farey observes "The miners generally descend to and ascend from their work by means of a ladder-shaft, or rather climbing-shaft, which consists of two vertical rows of stemples fixed across the vein, at about a yard apart, like two ladders. We understand this to mean like the two poles of a ladder, in fact a ladder minus the cross or foot piece, set upright, between which the miners straddle from one set of stemples to the other, holding at the same time by each, by which means they ascend and descend with the greatest celerity and safety." We are assured that miners accustomed to this mode, prefer it to a ladder, and further that those who practice the system can ascend and descend with greater dispatch than by the means of ladders. Perhaps our account would be incomplete if we did not describe also the mode occasionally adopted for carrying the ore stuff to bank in cases such as the one under consideration, where a perpendicular or straight drawing shaft does not exist; again we quote Farey: "The lumps of spar or vein stuff containing ore, the coper collects into shallow oval spel\* baskets called whisks, and these are taken from him by the boys, called setters-on, who carry the same a stage of about twelve yards, along the sole or gate of the mine, and then hand them to other boys, who carry them a similar stage and returning with an empty basket, until the stuff thus reaches the kibble or small barrel at the bottom of a turn or underground shaft, which kibble, when full, is wound up by the turn drawers, who convey it to another turn, and so on, etc., etc." "The author subsequently observes when a shift or a shift and a half of work is performed, he begins drawing the bunning or stemples forward. This consists in forming a hole in the solid side or skirt of the vein with the point of his pick, at about five feet above the sole, and opposite to it in the other skirt, striking out a sort of upright mortice in the skirt, whose bottom is level with the opposite hole; he then chooses or cuts a stemple or booth of the right length, that is a piece of wood of the size of a man's arm or larger, according to circumstances, having one end cut to a round blunt point called the egg-end, and the other square and a little loosened, called the head. This round point he enters into the hole cut in the skirt, and the other into the top of the mortice or groove cut in the opposite skirt, and then by a hammer or his mattock, drives the square end down to the bottom of the mortice, by which means the stemple becomes a firm and immovable strut across the vein; when four or five of the stemples are thus fixed, flat pieces of wood called fails are laid across these on which the coper proceeds to lay his deads, etc. etc.

\*The local name applied to parties similar to that of Triliter in Cornwall. The name for young trees or branches generally willow or hazel, about half an inch in diameter.

## Can a Steamboat be Propelled without an Engine?

The two recent inventions, known respectively as the Water Jet Propeller, and the Steam Syphon Pump, would seem to imply the possibility of an affirmative answer to the above question—nay, even render the accomplishment of the idea a matter of certainty. The only question is as to the economy of the plan.

The recent application of the water jet to the English Government steamer "Waterwitch," is pronounced by English engineers a success in every essential particular. The experiment has not been confined to this vessel alone, for we are told in the *Scientific American* of August 25th, 1866, that the principle was known and acknowledged on the continent before its application to the Waterwitch, and that vessels propelled by the reaction of water forced out of pipes "have actually been used for traveling, and are still in use."

The success of the Steam Syphon Pump is still more fully demonstrated, and may be set down as almost beyond the possibility of a doubt. One of these syphon pumps was recently tested at the Brooklyn (N. Y.) Navy Yard, under the direction of a Board of Naval Engineers, who reported that it raised in a given time 41.7 per cent. more water than one of the best piston pumps propelled by steam, and having the same area of discharge; but in doing so, it consumed 48 per cent. more coal; making the cost for fuel, for any given amount of work, 6.3 per cent more than that involved in the piston pump. This deficiency, however, the engineers state in their report, is fully made up by the economy of room, and simplicity of construction of the syphon pump; while its other advantages far exceed any other pump for the discharge of large bodies of water.

In the trial of the jet, on board the Waterwitch, we are told that an engine of 160-horse power was employed, which, by the aid of an immense turbine wheel, sucked in and ejected 300 tons of water per minute; the effect of which was to give her more speed than could be acquired by the same amount of fuel employed with the same engine turning screw or paddle.

What is now proposed is to substitute for the engine and turbine wheel of the Waterwitch, a steam syphon pump, to be worked by a jet of steam, thereby saving all the space occupied by the engine and turbine wheel for freight and passenger room.

That this can be economically done will be seen by the following simple calculation, which shows the power with which the 300 tons of water per minute, are ejected from the nozzles of the pipes employed. For convenience of calculation, we reckon the ton at 2,000 pounds. We have:

300 tons of water = 600,000 pounds  $\times 9 = 5,400,000 \div 33,000 = 163$ -horse power.

From this we draw the conclusion that it requires 163-horse power to raise the water to a height of nine feet; and the pressure due to the power and velocity expended in raising the water, is equal to the power with which the water is propelled from the sides of the boat—that is; the water is propelled with a force that would raise it nine feet. (A discrepancy of 3-horse power only, will be noticed between our calculations and the horse power set down for the Waterwitch.)

Having shown what is necessary to produce certain results, we will construct our steamboat by making the same kind of inlet and outlet as those employed in the Waterwitch, or any other that may suit our purpose better; but instead of putting in a cumbersome steam engine and heavy water-wheel to load down and shake to pieces the boat, we will merely insert a steady acting steam syphon pump, which will not occupy more extra room than a barrel of flour, and the action of which will be as steady as a steam conducting pipe. The height to which we will raise the water will depend on the fall we

wish to get. The vacuum created will raise the water to the desired height, and it will descend in the opposite direction by gravity, with a force precisely equal to its height and velocity. We now suppose the height to be nine feet, and the quantity of water 300 tons per minute. We have:

300 tons = 600,000 pounds  $\times 9 = 5,400,000 \div 33,000 = 163$ -horse power.

In this calculation no account is taken of loss by friction, etc. We submit it for the consideration of engineers, and should be pleased to hear from any one who may think it worth his while to go into a careful analysis of the same.

The *London Times* thinks the trial of the Waterwitch brings the English fairly abreast of the American, in the way of marine novelties. Where is the ingenious American who will now take one more step in advance, and from his new stand-point bid his English cousin "come on?" Will not the successful accomplishment of the idea suggested in the caption of this article, place the Yankee once more ahead of Johnny Bull?

ARIZONA ALL RIGHT.—Gov. McCormick of Arizona, who left on the steamer of January 26th for his home, carrying with him the good wishes of every body, has reason to be proud of the success of his mission. With him went four companies of U. S. troops—two of cavalry and two of infantry. Two companies of cavalry had already been dispatched through his instrumentality. General Gregg, of the late army of the Potomac, is in command.

Arizona is bound to "shine." The only drawback upon her progress has been the unsettled state of things resulting from insufficient protection against Indians. The Governor has gone directly to the root of the matter, in coming in person to lay affairs before the military authorities. His success shows that he "knew how to put the case." We shall now expect to see some more "regular bricks" from that quarter soon—some metallic ones. In our mining summary of this issue will be found intelligence confirmatory of the article in our last, on the mines of Central Arizona.

A NEW COUNTERFEIT.—A new counterfeit half dollar has made its appearance, which is pronounced very dangerous and not easy of detection, except on close examination. A correspondent of the *Alta* says that an analysis shows it to be composed of nickel 69.35, copper 30.66 = 100. The alloy is hard and difficult of fusion, but tough and malleable. Its weight is 10.18 grains more than the genuine coin, and it is a little thicker. On examining the lettering with a magnifying glass they will be found quite imperfect as compared with the genuine. The angle at which the shield rests against the figure is also four degrees greater. The above description will enable every person to readily detect the counterfeit on close examination; but the difficulty here is that the practice of passing silver coin from hand to hand in paper rolls, allows of its very general introduction, with small chance of detection, especially as its diameter exactly corresponds with the genuine coin.

THE QUARTZ CRUSHER of Bargion and Johnson, says the *Stockton Independent*, "is being manufactured at the Globe Foundry in this city. Several have been forwarded to the mountains. Each machine weighs about 4,000 pounds, and will crush as much rock daily as a 5-stamp mill." This institution has been described in a former number of the *MINING PRESS*.

JOHN WRIGHT, the manufacturer of the celebrated pick which has been so serviceable to the miners of this coast, is hard at work in his new shop, No. 229 Fremont street. It is next to the *Etna Iron Works*. Mr. Wright has always on hand a general assortment of picks for quartz and surface mining.

## The Removal of Blossom Rock.

On invitation of Capt. Bloomfield, we were present yesterday morning, to witness the second blast to be made for the purpose of removing that dangerous obstruction to our harbor, well known as Blossom Rock, and located a short distance inside of Fort Alcatraz. The charges are placed in a properly prepared cork, and lowered to the rock, in about sixteen feet of water. They are fired by a galvanic battery from a boat near by, through insulated wires connecting with the powder. Notwithstanding the complete success which attended the effort of the previous day, the attempt was yesterday unsuccessful, owing, as was afterwards found, to an imperfection in the insulation of the wire. The battery, which was an old one, had been carefully put in order for this work by Mr. Roach, the well-known mathematical instrument maker of this city, and was found to be still all right. Mr. Roach, who was present at the trial, showed this to be so, by repeatedly firing cartridges after the apparatus had been taken up and placed on board of a small schooner from which the work is directed.

By a series of experiments the failure was traced to a defect in the main wire, which was an old one, and which had undoubtedly been injured by previous use. These experiments were made with only four cells; whereas twelve were unsuccessfully employed in the efforts to accomplish the submarine discharge. Had a larger number of cells been employed, the wire, imperfect as it was, would probably have conducted sufficient electricity to have fired the charge, notwithstanding a partial loss of the current.

It strikes us that an additional battery would be a matter of economy in this work, and avoid delays from slight imperfections, which must always be expected in submarine operations of this kind. We presume the public will be advised of the hour when the next blast will be let off, which will be early next week.

During the operations of Mons. Mallefert, in 1851, at Hell Gate, near New York harbor, a battery of sixty 7-inch cells were used, with charges of from 125 to 250 pounds of powder. In the present operations on Blossom Rock, only twelve 3-inch cells are employed. The charge of powder on Thursday was 175 pounds; the same quantity will be employed in the next charge. Mons. Mallefert had two full boats crews to assist him, while the officer in charge here has less than half that number of men in employ. There is no doubt but that this serious obstruction to our harbor will soon be effectually removed, and at a small cost to Government. The work is being done under the supervision of Col. Williamson, of the corps of Topographical Engineers, who has placed Lieut. Ewer in special charge of the same.

GOULD & CURRY REPORT FOR 1866.—We have received, through the favor of David Bowie, Secretary, a copy of the "Seventh Annual Report of the Gould & Curry Silver Mining Company." It contains the report of the President, that of the Superintendent, and that of the Secretary, each of them models in their way. This is as it should be. A full, comprehensive, and detailed report like this, is what all honest companies should make at stated periods. We think, moreover, that such reports should be published by the directors in a *mining journal*, rather than in pamphlet form, in order that readers throughout all the States and Territories on this coast might have the benefit of the experience therein given. Much could be gleaned from such publications, the knowledge of which might save others expensive experiments, and perhaps expensive litigation. In Australia the Colonial laws make obligatory such reports as this; just as our own State laws require the reports of banking institutions. It would be well if such were the case here. We shall, next week, notice the report more in detail, giving therefrom some valuable statistics, interesting to miners generally.

(Special Notice.)

**Stewart's Patent Hinge Shoe and Muller-Plate Grinder and Amalgamator.**

This is one of the GREAT INVENTIONS of the age—can do more work with less power, and at less expense in a given time, than any other pan in use. While the most successful modes hitherto adopted have not succeeded in working ordinary gold and silver ores nearer than from twenty to fifty per cent., and silver ores, particularly, if at all refractory, in within fifty to two hundred per cent. of the fire assay, the former is guaranteed to work within ten per cent., while sulphurets work as low as fifteen to twenty per cent. of the same by this process.

That this has been done, can be proven by many reliable witnesses in this city, and experienced miners; and that, too, at a cost of but \$2.50 per ton for chemicals—a record unsurpassed on the coast—a result attained by long years of thorough study of mechanics and chemical principles, in connection with practical experience in quartz mining.

Of the four different sizes, the largest and smallest, with their respective capacities, are here given—the intermediate having proportions similar in every respect. The largest pan, with a diameter of five feet, makes forty revolutions per minute, works seven tons per day, and 2,500 pounds at each charge. The smallest, one and a half feet in diameter, with eighty revolutions per minute, works 600 pounds per day, and 100 pounds at a charge.

The following are some of the advantages claimed for this pan over all others:

1st. The grinding plates wear down evenly—no merit claimed by none other, even in theory, with possibly the exception of the Tractory Pan—the theory in this case being fully demonstrated by actual working; and the same may be said of the shoes, which, working on a hinge-joint, do not wear in grooves as in other pans; so perfectly adapting themselves to the dies, and also, from the fact that they are always gradually changing their position from the time the pan starts until they are worn out. The shoe is made fast to the plate by a convex portion on the center—said portion being three inches in diameter, three and a half inches high by three inches in thickness, and eight inches in length, a concave being cast on the under side of the muller-plate to receive the convex portion, while the shoe is held in its place by a key or staple, at the option of the purchaser.

From the foregoing it must be evident that as the shoe, touching the plate only in the center, and at liberty to play up and down *ad libitum*, must necessarily adapt itself to the bottom of the pan or dies, and, consequently, wear away uniformly.

2d. The muller-plate in the 5-foot pan being only three and a half feet in diameter, and but seven inches broad by four inches thick, covers but a small portion of the bottom of the pan, leaving the shoes and dies exposed, and thus giving the pulp a free circulation under and through the dies.

3d. Owing to the same cause, viz., the comparative smallness of the plate, not half the power is expended in throwing the pulp as in other pans.

4th. As the diameter of the cone in the 5-foot pan is about two feet, and as much the larger portion of the steam bottom lies within this cone, whose walls are only three-eighths of an inch thick, it must be clear, that, in consequence of the thinness of these, much less steam will be required to heat the pulp than through a bottom, as is ordinarily the case, of thirty inches in thickness. These are plain matters of fact, let them be borne in mind.

5th. For the reasons already assigned, it is the cheapest pan ever made, and reduces ore to an impalpable powder with much less power, and, at the same time, with an enormous increase in yield as compared with other methods. As evidence of the above read the following facts:

1st. Messrs. Cutter and Waters of this city, having worked 100 tons of ore at their mill—one of the latest style—in Calaveras county, got a yield of only three dollars per ton; 500 pounds of the same character of rock from their mine yielded in the hinge pan at the rate of forty dollars per ton; 100 pounds of picked rock, which they said they had been unable to get worked anywhere, returned by this process at the rate of \$120.

2d. One hundred and twenty pounds of rock, paying Mr. E. T. Steen, mill-working, only ten dollars per ton, paid in this pan \$150.

3d. Seventy pounds from the Harpending mine, near Lincoln, yielding from thirteen to fifty dollars under the stamps, in this worked up to \$95.75.

4th. Mr. Charles E. Abbott had thirty tons from the Pyramid mine, White Oak Springs, El Dorado county, carefully worked at the Union mill, near Diamond Springs, one of the best in the State, with the necessary copper plates, shaking-tables and champion pans—the Knox-pan, so widely and favorably known, among the number—and got a return of something over eleven dollars per ton; the sulphurets assaying about \$300.

Rock taken promiscuously from the same pile yielded, in Stewart's hinged-pan, \$100 per ton. Let these facts, out of hundreds that might be given, going to show the superiority of this over other pans, be well considered before purchasing elsewhere. The inventor guarantees to teach any man in ten days to work it as closely as he can himself. All these pans require is one of Wheeler & McAuley's Mammoth Crushers—to be seen at the Miners' Foundry, or in operation at Hunter's Point, near the city. It crushes ore as fine as flour—the fineness of duck-shot or of beans being sufficiently fine for the pan—and at the rate of two and a half tons per hour. In this way a mill can be built with a capacity of fourteen tons per day at a cost of only \$5,000. For further information, call upon J. H. STEWART, at the Miners' Foundry, where his pans can be seen.

**HENDY'S LATEST IMPROVED CONCENTRATORS,****FOR GOLD AND SILVER ORES,**

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

By this improvement the conical Feeding distributor has been entirely done away with. The feed in this machine is made to enter the conical hopper; from thence it passes through the hollow arm, leading to the T attachment, marked D, which is made to sweep slowly around the circumference of the pan, by means of the ratchet teeth upon the upper edge of the same, into which two pawls are seen to work. This motion is obtained from the vibrating action of the pan, as in common use. Upon the under side of the T attachment to the arm, are small openings or perforations, through which the pulp is dropped from the feeder into the pan. The constant revolution of this arm secures a more uniform feed than can be obtained from the conical feeder. A set of stirrers, with small projectors or teeth, is shown, which is also kept in revolution with the feeding arm, the design of which is to prevent the sand from packing near the center, where the motion is diminishing. The discharge orifice and box for receiving the sulphurets will be readily distinguished at box G, and the debris discharges near its center and passes off in the sluice F. These pans may be so connected, as in the cut, that two can be driven by one shaft and pulleys.

These machines have been thoroughly tested, and pronounced a perfect success.

The proprietor of this Concentrator feels satisfied that it HAS NO EQUAL in use. It is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets, and is to be placed behind any and all other machines in use. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

**CENTRIFUGAL FORCE AND GRAVITATION,**

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

**CAUTION.**

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1866."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,  
Union or Fulton Foundry, San Francisco.

Feb. 1st, 1867.

(Special Notice.)

**To Quartz and Cement Miners.**

I have received several communications from persons residing in different parts of the country, requesting me to send them a full description of my "Oro Pulverizer," its uses, capacity, etc., and as the PRESS reaches nearly every prominent miner on the coast, and will consequently come under the immediate notice of most of my correspondents, I propose, by your kind indulgence, to give them a general reply through its columns.

The description of the machine, now in operation here, is about as follows: The hollow cylinder, made of cast iron, open at both ends, is three feet in diameter, and is twenty inches high by one inch thick, weighing 600 pounds. It resembles a large tub without a bottom. The bed plate, also of cast iron, four feet long, with rounded ends, is three feet two inches wide, with a short flange on each side, by one inch thick, weighing 400 pounds, and looks like the top of a smooth table. The counter shaft is four and a half feet long by three inches in diameter, having a fly-wheel on it weighing 400 pounds, and two pulleys, one fast and the other loose, weighing about 200 pounds. On one end of the shaft there is a small wheel or crank containing a crank-pin, like that of an engine. There is a wrought iron band around the middle of the cylinder, which is so arranged that it may be tightened or loosened as circumstances may require. There is a wrought iron rod, eight feet long, connecting the band with the crank-pin, which works like the piston rod of an engine. The machine has a foot stroke, and when in proper motion, the cylinder slides forward and back on the bed-plate, between the guides, at the rate of from 100 to 110 strokes per minute. This quick motion shakes the coarse material around and together so violently that it is rapidly reduced, by attrition principally, to an almost impalpable powder, and in this condition it begins to escape under the lower edge of the cylinder, the weight of which completes the pulverizing so thoroughly that the material comes out as fine as flour. The advantages of these results to the experienced millman need no further comment.

The machine will require about a two-horse power to run it properly on heavy work; but on light work, such as sulphurets and sands, it will not take near so much; and I may answer that it will reduce all of the mineral and organic substances. I have already tested it on quartz, manganese, sulphurets, quartz sands, fire-brick, marble, gravel cement, plumbago, bone-ash, and soapstone, and in every instance have produced the most satisfactory results. As to its capacity, I am willing to guarantee that it will reduce at least three tons of gravel cement in twenty-four hours, by throwing out the larger stones or coarse gravel, as soon as the gold and cement is sufficiently rubbed off from the same, and it will reduce a ton of ordinary, or a ton and a half of decomposed quartz, in the same length of time. Sulphurets and quartz tailings can be worked even faster than the latter. All other minerals or ores may be reduced with equal or greater facility, according to the nature of the substance. It will do more work by wet than it will by dry crushing. The machine is plain and simple, is easily attended to, and its wear is uniform and very slow. Its working qualities may be daily witnessed at the Franklin Foundry, on Fremont street. Yours truly,

JAMES HITCHENS.

INDIAN WAR.—It is expected that during the coming summer Government will set itself seriously to the quieting of the Indians on the plains. It is high time. General Sherman, some time since, proposed that the Indians be restricted to districts north and south of the overland route. This, at least, should be done at once, however large a force might be required.

The new woolen knitting mill, on Turk street, in this city, is capable of making one hundred dozen pairs of "Shaker socks" per day.

**City Amusements.**

METROPOLITAN.—The attendance at this theatre proves the success of the Martini troupe in their efforts to please. This week the pantomimes of "Harvest Home" and "Soldier for Love" have been played, and although they have not the tricks of some others, they are full of fun. "Zampillero-station," by Paul Martini, is very graceful and well done. The "Vivandiere" and the vaudeville by the Howsons, make up a pleasant evening's entertainment.

OPERA HOUSE.—The varied and attractive bill offered on the occasion of Manager Maguire's benefit, was repeated on Tuesday night to enable those to witness it who failed to obtain admission the first evening. Wednesday evening "Griffith Gaunt" was presented, with John McCullough as Griffith, Mrs. Kate Dennis as Kate Feylon, Mrs. Jackson as Caroline Ryder, and Miss Coreoran as Mercy Vint.

ACADEMY OF MUSIC.—By request, Mrs. Weaver will give Readings at this house on Tuesday evening, February 1th.

**DEWEY & CO.**

ENGRAVERS AND PUBLISHERS  
Mining & Scientific Press.  
CIRCULARS FREE.  
SAN FRANCISCO.

**Perry Davis' Pain Killer.**

ORIENT.—Having used and witnessed the beneficial effects of Perry Davis' Pain Killer, I take great pleasure in recommending it to the public as the very best Family Medicine with which I am acquainted. In this establishment are employed nearly one hundred persons, and your Pain Killer has been used with the most astonishing results. For four years not a single severe case of cholera, summer complaint or dysentery, but has yielded like magic to the curative powers of the "Killer;" and for cuts, bruises, etc., it is in almost daily use, and with like good effects.

JOHN TANNER,

Foreman of Wrightson &amp; Co's Printing Establishment, Cincinnati, Ohio.

Sold by Druggists and all Dealers in Family Medicines. 4vt4-1m

**Remarkable Cure of J. Calwell,**

Who had all the symptoms of being in the last stage of consumption, by the use of ALLEN'S LUNG BALSAM.

DEATH, Hamilton County, Ohio, April 6, 1865.—MRS. HARRIS & Co's Cuts:—As I have reason to believe that Allen's Lung Balsam has been the means of restoring my health, I feel that the afflicted ought to know what it is doing. I was first attacked with a violent cough, attended with cold night sweats. My feet and limbs swelled. The above symptoms continued for months, until I became confined to my bed, and reduced almost to a skeleton. My physicians and friends considered my case as entirely hopeless; that I could not live. At this crisis I commenced to use Allen's Lung Balsam, which was strongly recommended to me for the cure of consumption. To the astonishment of all, I began to recover almost immediately, and in less than three months' time I gained sixty pounds. I owe all the use of Allen's Lung Balsam. I now enjoy good health. Respectfully yours, JAMES CALWELL.

Sold by all Medicine dealers everywhere. 4vt4-1m

**To Owners of Copper Mines and Smelting Works.**

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, desires a situation as Superintendent of an establishment for Smelting Copper. Address "W.," care of Mining and Scientific Press. 6vt4vt

**Brown's Filtering Heater!**

FOR PREVENTING INCORUSTATION IN STEAM BOILERS, purifies water from lime or any other impurities, saves fuel, saves the boiler, prevents explosion, and protects life and property. The cost of the Filter is soon saved by fuel and boiler—repairs alone. One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to 6vt4-4y AUSTIN A. WELLS, Agent.

**A. S. Hallidie & Co.,****MANUFACTURERS OF FLAT & ROUND WIRE ROPE.**

For Mining, Shipping, Ferry, AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach. SAN FRANCISCO.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one fault, the bulk of the rope is split and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure to have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—Round Wire Rope—Iron or Steel, for Hoisting. Flat Wire Rope— " " " "

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, saving in freight for remote localities. Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick Guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{3}{4}$  inch diameter, for hanging window sashes; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Favorable to Inventors.—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the MINING AND SCIENTIFIC PRESS, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curo Paw, Zenas Wheeler's improved flat bottom pan, Belkin's pan, Veatch's tubs, Frater's concentrators, Wakle's pans, Beers' pan, Cerman Barrels, Arastra Cearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Gams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all quantities of iron. All work done in the best manner at the lowest cash prices.

**EARTHQUAKE IN ENGLAND.**—An English paper refers to certain damage recently done, as was supposed, by a pitfall, as due to an earthquake; and says it was felt more or less distinctly throughout a considerable extent of country. We quote: "The injury done at Crook, it appears, is more serious than at first reported; the earthquake wave passed south by Wilton Park, Chorley and Toft Hill, where the shock has been severe, for on top of that hill we now have a valley, the turnpike road having sunk many feet. Some houses are as bad as any in Crook, whilst in many fields great yawning chasms have appeared, several feet deep. Next we trace it to Ramshaw Hough across Cockfield Fell to Wigglesworth; and here the shock must have been awful indeed, for whole fields have disappeared and sunk into the yawning depths below; and, strange as it may appear, here the wave has been checked in its southern course, and, turning west by north, has followed the coal field right up the Guanless, destroying much land and many houses, besides injuring several roads at Lynesack, Copley, Rowntree, and other places."

**STRUCK BY A FALLING STAR.**—During the meteoric shower in November, a star-gazing waiter in London, "got hit." It must be so, because the editor of the London *Morning Advertiser* says that Pike told him that while standing in the middle of the street, between Shoe Lane and Salisbury Court, with no one near him, and gazing upward, he became aware of a burning sensation in the neck, upon which he tore at his neck-cloth, and the next moment the burning substance passed down his left breast, scorching the shirt in all its course and inflicting three small but severe burns on the flesh, with one large wound.

generally, made to order, and warranted to give perfect  
satisfaction in every particular. 25v12-3m

NEVADA STATE MINING LAW.—Mr. Nourse introduced a bill in the Nevada Senate on the 11th, to repeal the State law concerning "the location and possession of mining claims." The *Record* says the law is defective and unpopular, and should be repealed, yet it hopes another will take its place. The district mining laws are seldom complied with, or at least are easily suspended or altered by a meeting of miners hastily called, and as a consequence, there is constant confusion regarding titles, and endless litigation. It goes on:

"It will be useless for our Legislators to attempt to make a law that will be universally popular, whether it relates to mines or anything else. A law should be passed regulating the location of mines and providing for their recording in the office of the County Recorder in such a manner that titles can always be ascertained and correctly traced. \* \* \* Let it be simple and inexpensive, but requiring that before a location is admitted to record, a certain amount of development shall be made, which shall be described in the record. This will prevent the location of valueless claims, and always furnish evidence of title."

LARD.—In the transportation of large droves of hogs to the Cincinnati market by rail-cars, many of them are crowded, and crushed, and suffocated to death. These are purchased by manufacturers of lard. Covered with filth as they are, they are tumbled into immenso steam boilers or tanks, and steamed until the most beautiful "Pure Steam Refined Lard" is drawn from the boilers by means of faucets.

### Bell's Assay Office.

THE UNDERSIGNED, HAVING FORMED A COMPANY, under this day, would inform the former patrons and the public generally, that they will continue the ASSAY BUSINESS in all of its branches, at the old stand,

No. 512 California street,

One door west of Montgomery, San Francisco, with the same employees, under the name of Rogers & Brown. MR. EDWARD WOLLER, for the last seven years Assayer for Mr. Bell, will have charge of the Assay Department.

The Melting Department will be under the charge of MR. HENRY J. FISHER, for ten years in the United States Mint in this city and Philadelphia, and for the past seven years with Mr. Bell.

We would inform Photographers that we are prepared to work their chloride of silver and ashes from their paper clippings.

We have, in connection with our Assay business a MILL, and are prepared to

WORK GOLD AND SILVER ORES,

in quantities from 25 to 500 pounds; also, Assayers' Sweeps.

GEORGE E. ROGERS, H. W. BROWN.

### CONNECTICUT

#### Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

#### THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,

The Largest Amount Insured,

The Largest Surplus,

The Largest Business,

The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT of the premium paid during the year ending 31st of January, 1863.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give interest in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums one-half.

When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

JAMES GOODWIN, HENRY C. ROBINSON, GEORGE S. GILMAN, GUY R. PHELPS, MARCUS F. HOLMES, E. D. HIFFANY, New York. CHARLES F. THAYER, Boston.

N. M. WATERMAN, JOHN C. PALMER, E. B. WATKINSON, THOMAS SISSON, Z. PRESTON.

GUY R. PHELPS, President.

Z. PRESTON, Vice-President.

W. S. OLMSTEAD, Secretary.

O. W. POWERS, Actuary.

A. D. SMITH & CO.,

General Agents Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13 p11

### Accidental Insurance!

#### The Accidental Insurance Company

OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident.

In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

#### ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

#### SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month, 2-10. 4 months, 5-10.

2 " 3-10. 5 " 6-10.

3 " 4-10. 6 " 7-10.

#### GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$3,000, and \$25 per week compensation, against Accidents of every description, Travelling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance in which the assured may at the time be travelling," but they are GENERAL ACCIDENT TICKETS.

#### SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

#### INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend it.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

A. D. SMITH & CO.,

General Agents for the Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13

#### RADICAL CURE

—OF—

#### RUPTURE!

Treatment of all Deformities of the Body, by DR. A. FOLLEAU'S process. 322 Washington street, up stairs, Washington Baths Building, between Montgomery and Kearny streets.

#### DR. A. FOLLEAU

Has his studies and manufactures in the same building. Every kind of Apparatus, Trusses, orthopedic Instruments, Artificial Limbs, etc., are manufactured and applied by himself.

He has no connection with any Agency. 8v13-1y1p

#### Quartz Mill Construction and

#### Superintendence.

THE UNDERSIGNED IS AT PRESENT OPEN FOR AN engagement as a working Superintendent in the construction or operation of a Quartz Mill. Has had five years steady and successful experience in working ores in Washoe, and is practiced in saving sulphurets and the treatment of rebellious ores. Is prepared to furnish references for all the necessary qualifications of an intelligent, faithful and reliable quartz operator. Address F. M. SHAW, San Francisco, care Mining and Scientific Press. 14v13-1m

**Cherokee Flat Blue Gravel Mining Company,**

Cherokee Flat, near Oroville, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of January, 1867, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Company's office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of February, 1867, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighteenth day of March, 1867, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. P. SENAULT, Secretary.  
Office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, Cal. feb2

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Millers' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

## V. CUSHING, Agent

—FOR THE—

## Purchase &amp; Shipping of Machinery

OF ALL KINDS.

Especially attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to—

Governor F. F. Low; C. T. Meador, Stockton; Jacob Underhill & Co., San Francisco; J. W. Slove, Russell & Erwin Manufacturing Company; Office, No. 120 Front street, San Francisco.

HUNTER'S  
IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

VARNEY'S  
PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the  
PACIFIC FOUNDRY,  
1v1 San Francisco.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this improved Machine for Breaking or Spalling Quartz or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price \$600  
No. 2.—Or 16-inch Crusher, capable of similarly pulling through five to six tons per hour..... \$850  
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour..... 1,200

EXPLANATION OF THE ABOVE ENGRAVING. The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass over it. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate to the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,

Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be reduced to the sum of \$100 per Barrel.

A diagram, with explanation of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers. A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes,

GAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.

Country Orders punctually attended to. 19v13-q

## To Quartz Miners and Others.

NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, (which I have called the

HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject examine it. Patent applied for. 19v14-3m

JAMES HITCHENS.

[Written for the Mining and Scientific Press.]  
The Value of Pans in Working Auriferous Quartz.

MESSRS. EDITORS:—In many of the quartz mills in this State which have come under my observation during the past year, grinding and amalgamating pans are not used. Sometimes a 20-stamp mill is supplied with one or two small sized pans to work blanket tailings. Aside from these limited facilities all of the gold runs to waste, except what is saved inside of the battery, and on the copper plates outside of the same. To be sure we occasionally see a mill supplied with shaking tables, which is a very good auxiliary in saving gold and quicksilver, running to waste from the batteries.

Many millmen object to the use of pans because of the length of time required to work ores by that process. In working

ores that are free from sulphurets, and in which the gold is very coarse, the use of grinding and amalgamating pans may possibly be avoided without great loss; but in mines where the gold is very fine, and the rock more or less interspersed with rich sulphurets, it is utterly impossible, in my opinion, for the best kind of battery and shaking tables to save as much gold as could be saved by giving the ore the benefit of careful working in good grinding and amalgamating pans.

Let me give an illustration of my own experience in these matters. A few months since, a lot of ore taken from a mine in which I am interested, was worked at a mill having an excellent battery, with copper plates inside and outside of the same, and good shaking tables; and I will also add that the men who worked the ore were experienced miners and millmen, and I am well satisfied that they worked it as close as anybody could probably do with the same facilities. The result was eleven dollars per ton. To be sure the mill had limited facilities, by which a couple of tons or so of blanket tailings were saved from this lot of ore, assays of which show conclusively that they contain nearly as much gold as was saved from the battery and shaking tables. But what is the use of blanket tailings in a mill that has no facilities for extracting the gold from them; or, in other words, how many years longer is it required to learn millmen and quartz miners the necessity of completing their mills, before attempting to work gold or silver ores.

I would further state in reference to the working of this lot of ore, that the mill tailings, as they passed from the mill, have been proven to contain eighteen dollars to the ton.

Now this same kind of ore by being crushed and worked in Stewart's grinding and amalgamating pans, [elsewhere fully described in the present issue—Eds. Press] yields \$35 to \$40 per ton; and quite recently I had some ore from the same mine worked in one of the above mentioned pans which yields at the rate of \$80 per ton, being at least \$50 more per ton than could possibly be saved from the workings of a battery and shaking tables.

QUARTZ PROSPECTOR.

GREEN VALLEY, El Dorado Co., Jan. 22d, 1867.

[Written for the Mining and Scientific Press.]

## California Oak for Wine Casks.

EDITORS PRESS:—In your notice of my experiment for using our native white oak timber for wine casks, the word "thousand" has been substituted by mistake for hundred.

I am not aware of any wine cask having been made in California of one-third the capacity of "nine thousand gallons"; but the rapid increase of the wine-producing business will soon demand the construction of tuns holding tens of thousands of gallons each, and it will be most fortunate for the vine-grower if he can find timber at home suitable for the purpose.

It is generally supposed that the oak of this country is not only too porous for wine casks, but that it is so highly charged with tannic and gallic acids as to impart a taste to the wine; but I have found less leakage from new casks made of wood which grew on bottom land near Napa Creek, than from Eastern staves bought in San Francisco.

That the acids and astringent matter can be effectually deterged from the timber, I think is proved by the fact of my having kept stored in that kind of wood, for over a year, a delicate claret, the juice of the black Malvoine grape, and it has suffered no deterioration whatever, but continues to improve by age. Both lime and steam were used to cleanse the casks.

G. B. CRANE.

St. Helena, Cal., Jan. 27, 1867.

**THE METEORIC SHOWER TO AN ALPINE TRAVELER.**—The correspondent of the Springfield Republican was among the Alps at the time of the November star shower. We copy a part of his description of the scene which he witnessed:

About one o'clock in the morning the signal was heard, and we soon gathered around our sentinel, on a rocky ledge that commanded a view of every quarter of the heavens. The clouds by that time became numerous and thick, but would, now and then, separate in the most tantalizing manner, and reveal for a moment the glorious scene beyond. Meteor succeeded meteor with such rapidity, that the account kept was almost worthless, so much did the different counts vary. Many strikingly large and brilliant meteors were observed, but their course could not be carried far by the reason of the many clouds. A few, twice the size of Venus, apparently, were seen, but most were of inferior brilliancy. Long trails of luminous matter marked the course taken by many, and these "tails" often remained long after the meteor itself had disappeared. They were, in fact, often more brilliant than the meteor, and sometimes seemed to have more than a single head, as if two or more had blended together. Many of these trains must have been, though their length could not be seen by reason of the clouds, at least twenty degrees long. The meteors that we were fortunate enough to have seen, seemed to all come from the constellation Leo. I have no doubt that, had the night been clear, we should have seen thousands. As it was, before the clouds had entirely covered the sky, we saw enough to know that the grandest exhibition of the kind that could be imagined was there transpiring, thus adding another proof of the accuracy of astronomical predictions.

The *Alt* says that a San Francisco capitalist recently caused an examination of the Savage mine by an expert, who made the following report: "From a most critical examination, and not making any allowance for the ore remaining above the sixth station, there is in sight over \$2,000,000 in dividends. This is no guess work, but from measurements of the ore as actually developed by drifts and winzes."

THE GRANITE FLOURING MILLS, at Folsom, were destroyed by fire on the 26th January. They cost \$140,000.

### Gaston's Screw Grinder and Amalgamator

The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw miller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the miller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the miller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the miller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada.

best article ever introduced into the market. By a com-  
bination of the movement of the ball and socket, and the  
movable arm, any desired angle may be obtained. Call and  
examine for yourselves. A liberal discount to the trade.  
SHEPARDSON & GATES, Agents.  
22v13-3m Corner Sansome and Commercial streets.

### Rheumatism!!

### Still Another Witness!

Lafayette, Cal., Sept. 19, 1866.  
(While Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years,  
been afflicted with Chronic and Inflammatory Rheumatism,  
and the sufferings and tortures I endured in consequence  
cannot be told. I have, at an expense of thousands of dol-  
lars, employed many physicians, both in this country and  
in Europe (where I was born and resided many years),  
among which were several eminent professors of medicine,  
and I experienced no benefit from their treatment, more  
than at times a slight and temporary relief.  
About two years ago I was induced, by some persons who  
had been cured by it to use Richard's Remedy for Rheuma-  
tism. It is enough to say that I was almost immediately re-  
lieved, and that I have not suffered with it since. I keep  
the medicine on hand, and, on the first approach of any  
returning symptoms, I take a few doses, which invariably  
puts it to flight. I therefore cordially recommend it to the  
afflicted as an unfailing remedy for Rheumatism.  
FRED'K FABER.

RICHARD'S REMEDY is for sale by  
H. BOWMAN, Druggist, Sacramento,  
And by Druggists generally.

Notices to Correspondents.

Dr. Kellogg read an elaborate paper upon the "Fungi," being a continuation of remarks upon the subject made at a previous meeting, showing the use of certain species as an article of food, the intoxicating effects of some varieties, the destructive effects of others, those which not only the soft and hard woods are destroyed, but also solid masonry.

Prof. H. N. Bolander and Dr. C. A. Stivers made some remarks upon the geographical distribution and properties of a species of *Algae*.

Mr. L. Falkenau, of the Pacific Chemical Works, stated the result of certain chemical tests which he had made of the coloring matter exhibited by Dr. Behr at a previous meeting, and owing to the minute quantity of the material, he could only ascertain that weak and dilute acids did not attack the substance, while alkalis seemed to combine with it. As soon as a larger quantity could be obtained, he would continue his researches.

## Manufacturing Barrels by Machinery.

The growing demand on this coast for barrels and kegs of various kinds, has induced a number of capitalists to undertake this manufacture on an extensive scale, by machinery, the building for which will be a large two-story structure, now in a forward state of completion, by the side of the rope walk, on the Potrero, and at a point near which the Potrero and Bay View Railroad will pass over the walk, at a height which will clear the roof thereof by merely cutting a few inches from the ridge of the same. The parties interested in this new enterprise have gone about it with much deliberation, and an abundance of means. They have employed an expert to visit the principal manufactories of this kind in the Atlantic States, with the view of selecting the best and most improved class of machinery which has been fully tested by actual work. The machinery procured for this purpose consists of stove cutters, headers, planers, shapers, etc., all of which have been purchased and reached this city by a recent arrival. A steam engine of about 30-horse power, to drive the same, is nearly completed at the Union Foundry. The capacity of the works at the start will be 8,000 staves per day, which capacity will be increased as fast as the demand for barrels shall warrant the same. The timber for this manufacture will be drawn from various localities on this coast, from Oregon, Victoria, and the upper portions of Placer and Nevada counties in this State, from which latter locality it will reach this city over the Central Pacific Railroad and via the Sacramento river. This manufactory will turn out every kind of barrel or keg required by the various industries on the coast—from a common flour barrel or molasses keg to the most expensive wine cask. Various kinds of timber will be employed, suited to the different purposes for which the casks may be required.

This enterprise is one the want of which has long been felt in this community. There is no lack in our forests for material to work with, and it is quite evident that there is a wide and growing field for a profitable business on a much larger scale, even, than any which has yet been contemplated. There is no reason why California should import either barrels or material for making them, and the sooner we are able to supply our own wants in this particular, the better for all.

**SUIT FOR INFRINGEMENT.**—The case of W. A. Palmer, of Palmer, Knox & Co., Golden Gate Iron Works, of this city, versus Mead & McCane, foundrymen, of Silver City, Nevada, has been decided in favor of the plaintiff. This is the third trial; the others resulted in a similar decision. The suit was for an injunction on the manufacture of steam chests placed underneath amalgamating pans, for the purpose of treating the pulp and thereby increasing the efficiency of the pans in the reduction of ores.

**PERSONAL.**—We notice among the passengers for the East, by to-day's steamer, the name of Melville Attwood, of this city. No man among us has probably had more experience in mining operations on this coast, or become more generally and intimately acquainted with the rise, progress and future prospects of this great leading industry, than has Mr. Attwood. Coming to this country in 1852, as the manager of one of the earlier English mining companies, organized to operate in California, he brought with him a large experience in mining, gained in his native country and in Brazil. He continued in active employment as a mining manager until some five years ago, when he removed to this city, where he has since acted in the capacity of consulting mining engineer. His large experience, ripe judgment and well known probity, have secured for him the almost unlimited confidence of capitalists, and more money has probably been invested in mining operations, on his judgment, than that of any other man in California. We have had the pleasure of an intimate acquaintance with Mr. Attwood, for some ten or twelve years, and so far as our information extends, every enterprise which has thus far been undertaken under his advice, and been fully carried out, has proved a success. Mr. Attwood was the first person to make known the true character and value of the famous Comstock lode of Washoe; and his knowledge and judgment has been of inestimable value to stockholders in the various companies along the line of that lode, who have availed themselves of his counsels in selecting the proper time for purchases or sales of stock in that remarkable series of mines. In addition to a full and thorough knowledge of our mineral resources, progress and necessities, Mr. A. carries with him to England models of machinery, plans of mills, etc., with which he will be able to convey to the capitalists of that country a full and intelligent idea of our resources, and the flattering prospects they hold out for profitable enterprise, when investments are made with judgment and conducted with that skill and experience which Europeans so well know how to appreciate and turn to advantage. Mr. Attwood visits his former home, at this time, in consequence of the severe domestic affliction with which he has recently been visited, and which has deprived an interesting household of a maternal head. He takes with him his two daughters, hoping that travel and a change of scene may once more bring to blooming cheeks that glow of health which was theirs before the fell destroyer entered their happy home and laid his hands heavily upon their earthly hopes and support. He proposes to return with his charge early in the ensuing fall. During his absence, he will visit and carefully inspect all such mining and metallurgical operations as he may think will afford him useful information, or hints which may be turned to the advantage of Californians. He will take full notes of the same, and communicate them to the public through the *MINING AND SCIENTIFIC PRESS*. Our readers may therefore expect some valuable information from his pen, both during his absence and after his return.

## California Academy of Natural Sciences.

### REGULAR MEETING.

SAN FRANCISCO, Feb. 4, 1867.

President in the Chair. Twenty-seven members present.

Messrs. C. Von Liehenau, L. Gilson, Delos J. Howe, R. S. Williamson, R. d'Hercuse, Rev. J. F. Harrington, H. C. Hyde, G. B. Hitchcock, Jacob Bacon, J. P. LeCount, Amory F. Bell, W. C. Walker, Dr. George H. Powers, and Dr. Thomas Beunett, were elected resident members.

Seventeen propositions for resident membership.

Professor Whitney read an interesting paper upon "The Fresh-water Infusorial Deposits of the Pacific States, and their relations to the Volcanic Masses." One object of this communication was to give an idea of the extent and distribution of the rocks which are made up, to a large extent, of the *Diatomaceae*, or those minute organisms of which a hundred million go to weigh a single grain. These rocks occur over a vast extent of country, from Santa Barbara north to the Columbia river. Those made up of fresh water organisms are limited to the Sierra Nevada and the region east and north, the most extensive deposits being on the east side of the range. The marine beds, on the other hand, occur in the coast ranges, and form a large part of the rocks, which are the principal repository of the bituminous substances occurring in this State. These rocks are of Miocene age, while the fresh-water deposits are Pliocene and Post-Pliocene. The principal object of this paper was, however, to set forth the connection of the fresh-water infusorial beds with the volcanic masses of the Sierra and to show that Ehrenberg's idea, that the infusoria came from great depths, and were really of an eruptive origin, were not supported by the facts. Reasons were given why these microscopical organisms were propagated with such rapidity and over so great an area in the volcanic region of the Pacific coast, and it was shown how such deposits were preserved from subsequent denudation by the capping of indestructible basaltic lava, which was afterwards poured over them. It was, in the opinion of the author of this paper, not difficult to explain all the phenomena of the occurrence of these infusorial beds in connection with volcanic masses, without adopting any theory of a deep-seated origin for the former, or an extremely superficial one for the latter. In conclusion, the author expressed his intention, at some future time, of bringing up the subject of the marine infusorial deposits, and remarked that he expected to be able to show that the bituminous substances found in the State were derived principally from infusoria.

**AMERICAN PICTURE FRAMES.**—A New York agent of a picture-frame manufacturing House in Hamburg, Germany, and himself a German, recently became so impressed with the superiority of the style of the American moldings, over those of his own countrymen, that he sent out a lot of American patterns, with the suggestion that they should be imitated by the Hamburg house. The House there was so well pleased with the styles that they did not hesitate to comply with the request, and the New York market is now supplied with American styles of moldings, made in Germany. A recent arrival in this city from Hamburg brought a lot of the same style of picture frames for the San Francisco market. This speaks well for American taste, but ill for American mechanism; inasmuch as our mechanics should not allow foreign manufacturers to underbid us in our own market, especially when those foreigners have to borrow the ideas of our designers for their work.

O. J. HOLLISTER's work, entitled "Mines and Mining in Colorado," will be published in New York about March 1st.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

(Written for the Mining and Scientific Press.)

## Plumbago--Graphite--Black Lead.

BY DR. L. LANSZWEERT.

(Continued from Page 66.)

## TRANSFORMATION OF AMORPHOUS CHARCOAL INTO GRAPHITE.

The crude metal of liquid cast iron which runs from the smelting furnace, is merely a solution of amorphous carbon, mixed with the mineral matter and impurities from the ore, also in solution, produced by the combustibles employed in the furnace. The ingots or pigs obtained from the cooling of the molten iron contain, as one twenty-fifth part of their weight, *scaly graphite*, identical with native graphite, and which can be easily separated from its metallic envelope.

To isolate the graphite from the iron; re-melt the latter, which, when liquid, runs, leaving infusible crystals of graphite; or, dissolve the cast iron in acid, and the graphite not acted on will be found as an insoluble residue.

## ARTIFICIAL PRODUCTION OF THE DIAMOND—ITS POSSIBILITY AND PROBABILITY.

The facility with which graphite is produced artificially, by the solution of ordinary coal into cast iron, leads to the supposition—a priori, of the possibility of a further step in the same direction; with the probability of the chemist being able, at some future time, to crystallize carbon into a still more dense and perfect form—even into a diamond more perfect than that gem is found in its rough state, in nature. Although the numerous efforts made in that direction have not yet been crowned with success, still there exists no reason, either physical or chemical, which is opposed to the possibility of a final result, as above, to such experiments. On the contrary, the artificial production of the diamond, either through crystallization of carbon from a solution, or by its elimination, from convenient condition, from some of its gaseous combinations, liquid or solid, would be in perfect harmony with the progress of modern discoveries.

## THE ARTIFICIAL PRODUCTION OF CERTAIN PRECIOUS STONES.

Within a few years, we owe to Ebelman the discovery of a method for the artificial preparation of corundum and white sapphire, obtained by the crystallization of alumina dissolved in fused borax. This solution has only to be concentrated by evaporation or slow volatilization of the borax, exposed to a very high temperature, in a porcelain furnace. Rubies, and other precious colored stones or gems, having alumina for their base, can also be obtained in the same way, with the slight modification of adding small quantities of colored metallic oxides to the solution of alumina in the fused borax. Although the gems thus artificially prepared have, till now, only been obtained of small size, such as those used as pivots for watch movements, etc.; still the laws of crystallization allow us to affirm, beyond possibility of intelligent contradiction, that in operating on larger masses, and taking more time, *proportionately larger crystals would be obtained.*

However marvellous may be the idea of transforming coal or graphite into diamond, that circumstance should interpose no check to our efforts in that direction. The idea is a very different one from that of the transmutation of metals, which, whatever may yet be discovered, has, as yet, no foundation in science.

Even among the chemical discoveries of the last decade, there are those which may be pointed out as almost, if not quite as extraordinary, as would be the conversion of carbon from some of its more ordinary forms into the hard and brilliant diamond.

## RECENT RESEARCHES ON GRAPHITE.

Leaving out of the question the interesting and seductive hopes growing out of the well known chemical relations between graphite and the diamond, the former substance,

of itself, is so valuable in the arts, so scarce in nature, and so full of interest to the scientific and practical chemist, that it has a right to a large share of our attention; and we propose to consider it at considerable length, with the view of its utilization among the growing industries of the Pacific Coast. Especially is this important at this time, when we are finding it in California in a profusion no where else met with, and at points of convenient access.

It will be interesting in this connection to note that at the First International Exhibition at London, in 1851, the committee to whom was referred that particular branch of manufacture, reported a most important improvement in the manufacture of graphite, introduced by Mr. Brockerson. That gentleman, aware of the fact that the graphite of Great Britain was rapidly becoming exhausted, and that it was already difficult and costly to procure masses of this mineral, of sufficient purity and dimensions to admit of its being cut up into the lengths proper for being manufactured into lead pencils, set himself to the task of devising some method by which he could render serviceable for such purpose the smaller fragments which could still be obtained of sufficient purity, but lacking only the size requisite for such manufacture. He finally succeeded in devising a method for compressing pulverized graphite into blocks, as homogeneous, coherent, and dense as the natural blocks. By this method a new value was obtained for a hitherto comparatively worthless material. At the last London Exhibition the highest honorable distinction was awarded to Mr. B. C. Brodie, for his new and successful improvement in the application of graphite.

A rapid *expose* of the various scientific researches into the character and application of graphite, will enable the reader all the better to appreciate the value of their industrial results. In the following observations it should be borne in mind that the results detailed depend in a great measure upon the *allotropy* of the material—i. e., the faculty possessed by certain substances to acquire properties entirely different from those they present under ordinary conditions, without addition or loss of weight—the change being brought about by an internal modification of their molecules, the nature of which is quite unknown.

One of the most familiar and best characterized examples of this kind of change is found in the red or amorphous phosphorus, with which all are familiar, as the red colored preparation seen on the tips of certain kinds of matches, or on the prepared surface, by friction on which alone, certain matches can be made to light. This kind of phosphorus is prepared from the common article, by simply submitting it to the prolonged action of considerable heat. Almost every one is acquainted with the peculiar properties of common phosphorus—its transparency, white-yellow appearance, its ductility, excessive inflammability, ready solubility, and its poisonous quality. Why, when this substance is changed (without addition to it or extraction from it of the slightest particle of its composition) to an amorphous or allotropic phosphorus, it should become opaque, of a dark-red chocolate color, not ductile, but hard and brittle, inflammable only at a high temperature, absolutely insoluble, and non-poisonous, is one of the questions that has not yet been answered. The change is certainly not less marvellous than would be the conversion of carbon from any of its ordinary forms to that of the diamond, and which is still nothing but carbon metamorphosed.

In the dreams of the transmutation of metals indulged in by old alchemists, there is certainly nothing which was essentially less probable or less possible to human understanding than the phenomena of allotropism, which are universally known and acknowledged by every chemist. The facts of allotropism could very well and with good reason be described as facts of transmutation—the name only would be changed; the results would be no more remarkable. The phenomena of the admitted occurrence are involved in a mystery as deep and incomprehensible as any thing absolutely unknown well can be.

## GRAPHON OR GRAPHITUM.

For a long time chemists have admitted that the three substances—charcoal, graphite, and diamond—were merely allotropic modifications of one and the same material, to which has been given the generic name of *carbon*. Mr. Brodie has demonstrated that the allotropism of those substances is characterized by difference of properties more marked than even those which distinguish the two allotropic states of phosphorus; in fact, that whether the one or the other form of phosphorus be submitted to the action of a given chemical agent, the final result will be the same. Thus, amorphous phosphorus,

as well as crystallized phosphorus, oxidized by nitric acid, produces in either case phosphoric acid; and chloride of phosphorus is also obtained, no matter which kind of phosphorus is submitted to the action of chlorine.

Graphite differs so much from amorphous or ordinary coal, that it appears, as it were, a distinct element, producing compounds entirely different; and possessing even another equivalent. It has been shown by the experiment of Mr. Brodie, on graphite, that this substance presents special characteristics so transient, and chemical analogies so marked and apparent, that, with reason, it can be classed under the distinct name of *graphon* or *graphitum*, next to the elements of silicon, boron and zircon.

It is impossible to give, within the brief space allotted to these papers, anything like a description, in detail, of Mr. Brodie's scientific researches in this direction. The following, however, will suffice to demonstrate the notable differences of chemical characteristics which distinguish carbon in ordinary coal from carbon in its allotropic condition of graphite.

When ordinary coal (lamp-black, or coal from calcined sugar) is heated in a covered vessel, with an ordinary mixture composed of one part of nitric acid and four parts of sulphuric acid, it oxidizes rapidly, producing a black substance, soluble in the mixture and strongly acid, but precipitated from it by the addition of water. This precipitate, when washed and dried, is insoluble in acid or saline solutions, but soluble in pure water or alkaline solutions.

Treating in the same way graphite (especially the *scaly* variety), it takes on a beautiful violet tint, and crumbles in the acid liquid. This product, washed with water, presents again the aspect of graphite, but of a deeper color, and is insoluble in all the reagents. By analysis we find it to contain not only carbon, but oxygen, the elements or constituents of water—and those of sulphuric acid. Even in boiling this compound in a concentrated solution of caustic potash or soda, sulphuric acid is not taken from it, neither does it show any sensible loss.

Amongst the most remarkable characteristics of this curious product, may be mentioned the fact that, when submitted to the action of a red heat, it swells rapidly, evolves gases, and reduces itself to a powder of extreme fineness, which is nothing more nor less than graphite in a perfect state of molecular disintegration!

[To be Continued.]

(Written for the Mining and Scientific Press.)

## Mining in and about Nevada.

NEVADA CITY, Cal., Jan. 27.

EDITORS PRESS:—Notwithstanding the tornado that has recently swept through this vicinity, and the unprecedented fall of rain and snow, we still survive. Nearly all companies prospecting for quartz or cement, unless with machinery, have been compelled to suspend operations. Judging from appearances, the yield of gold has been less for the three months past than the general average. This falling off, however, is only temporary, and the causes producing it will, before the season is over, prove beneficial. The county has increased largely in population and wealth within a year; but I am frank to say that the addition of the latter has not been equal to the former. In a county as easily accessible as this, population is attracted sooner than capital. Nevada (State), Montana and Idaho, have contributed to swell our numbers, but not our taxable property. Grass Valley has added fifty per cent. to its population within a year, and has grown much more rapidly than Nevada or any other town in the county, and is probably the third place in the State in size, and if its mines could be taxed for what they are worth, its real estate and personal property combined, would cause its assessment roll to rank next to that of San Francisco. Sacramento and San Jose may demur to this last statement, but it is true, nevertheless. From consultation with bankers, express companies, and all the best sources of information, the gold yield for the year 1866 in Nevada county was not far from ten millions of dollars, or fully one-third of the entire yield of the State for the same period. I am not aware that there is a single county in the United States whose yearly report of agricultural products equal in value the amount of bullion sent from this county,

and yet there are counties whose assessment value would be vastly greater.

The snow, on the 20th of January, was sixteen inches deep in this city, and the sleighing, for a day or two, comparatively good. I have but few mining statistics to offer you from this locality, from the fact that but few quartz companies are taking out rock, most of them having been engaged in sinking for new levels, prospecting, or repairing machinery for more vigorous operations when the weather shall be less unpropitious. The Nevada Mill and Mining company, two miles below the city, on Deer Creek, took out and crushed during the past year 5,250 tons of rock, yielding \$42,000, or eight dollars per ton. Their ledge is from five to fifteen feet thick, and the quartz is all taken out by means of tunnels run into the hillside above the water level. Although the ore is of a low grade, yet the mine has been worked more steadily, and has turned out more gold than any other in Nevada township.

A mine owned by Thomas Findley and others of Grass Valley, immediately below the Nevada company, on the bed of Deer Creek, was opened last summer and fell to the depth of sixty feet, where the ledge is fifteen inches wide. Some ten thousand dollars was taken out in a short time, the rock averaging over sixty dollars per ton. When the rains came, work was suspended for want of hoisting machinery. The company intend erecting hoisting works and mill in the spring.

The California mine, owned by Pattee, Ferre and others, has been opened to a depth of 240 feet by the incline, which is twelve feet wide, and substantially timbered. Perpendicular depth reached 140 feet; depth of the new level below the old one sixty-five feet.

The Banner mine is turning out a large amount of rock, which is said to pay well. Its owners being exceedingly reticent, no particulars as to the number of tons of rock crushed, or its average yield can be made public. The fact, however, that they intend to erect a 20-stamp mill in the spring, in addition to the 10-stamp mill they already have in operation, is pretty good evidence of the productiveness of their mine. The Union mine, near the Banner, has been closed on account of the influx of water caused by the late storm. More powerful hoisting machinery will have to be procured before the mine can be successfully worked.

The incline in the old Whigham mine is now down 250 feet. They have out 200 tons of ore, which will probably yield sixty dollars per ton. The owners of this mine have recently purchased machinery in San Francisco for a 10-stamp mill, which will be erected as soon as the weather and roads will permit. The Whigham and Banner are considered the best developed and most reliable mines in Nevada township.

The Willow Valley mine, owned by Marcellus, Eddy, Welch and others, has been idle for about two months. Some repairs are being made to the machinery for the hoisting works, and work will be resumed early in the spring. The Pennsylvania mill and mine are being actively worked. The incline is now down about 200 feet, at which depth good rock is being taken out. No discoveries of quartz of any importance have been made about Nevada for months past, and but little prospecting has been done except by machinery.

Black & Co's quartz mill, near Eureka, which was completed last October, and has ten stamps, has crushed 200 tons of rock since its erection, which yielded about \$3,000, or fifteen dollars per ton. The company are waiting for fair weather, so that they can introduce pans for grinding the pulp when they crush more rock. Their ledge is from two to four feet wide, and they have some two hundred tons of ore out near their mill.

The 15-stamp cement mill near this city, owned by Marcellus & Co., suspended operations recently for want of timber for their mine. As soon as the roads are settled so as to be passable, work will be resumed in the mine, or rather the old river channel, and the mill will be kept busy. Some seventy-five tons of cement or gravel is crushed daily at this mill when it is in operation.

At Meadow Lake the people are struggling under ten feet of snow, and with the exception of the General Grant and one or two other mines, but little progress will be made before next summer.

To sum up all, the extraordinary fall of snow and rain has been a temporary detriment, on the whole, to all branches of mining, but a few weeks of fair weather will place things generally in better working order than before, and next summer will be apt to see the mining industry of the county more prosperous than ever. GREGGIAN.

## Mechanical.

## Improvement in Iron Manufacture.

A matter which we have often wondered has never been attempted, is now announced as having been successfully accomplished in Austria, and repeated by Mr. Jonas Heuderson, of Brooklyn, N. Y. It is well known that much difficulty is encountered, from various causes, in the process of mixing the metals, manganese, Franklinite and titanium with iron, as is now done to some little extent, in order to improve the quality of the latter metal, to render it hard, more steel-like, etc. It is also found difficult to fuse these ores in the presence of iron ore, as the titanium, etc., has been found to refuse to mix with the iron, preferring to form a silicate, and go off with the slug.

The Austrian process has obviated this difficulty, by charging a properly constructed blast furnace with a mixture of iron and manganese ores, or indeed, any of the magniferous iron ores, or ores of Franklinite or titanium, so that there is formed on the hearth of the furnace a molten mass of metal, alloyed with metallic manganese, Franklinite or titanium, in such quantities that it may be run directly into a Bessemer converter and subjected to the usual process of decarbonization, with this advantage over the ordinary method, that the manganese, etc., is thoroughly incorporated, and exerts its beneficial influence from the very beginning, instead of being introduced near the end of the pneumatic process or by an entire afterapplication. By this mode, it is claimed that Bessemer steel, improved by the above alloys, can be furnished much cheaper than by the other method, and finished bars, rails, plates, etc. can be produced by the same heat that melts the ores into crude or east iron. The plan is said to be in successful operation in Austria, and will soon be introduced into this country.

If the above statement is correct, a most desirable object has been gained in the manufacture of iron. The cost of obtaining the above alloys, has been an impassable barrier against their general introduction. We have, from time to time, for the past two years, made frequent allusion to the desirability of such an object, showing the vastly increased superiority of iron or steel alloyed with even as low as one or two per cent. of these alloys. Our readers will doubtless well recollect the experiments lately made in England with the titanic iron sands from New Zealand. A similar effort was made about a year ago to produce titanic iron from a similar sand, which is found in considerable abundance in the ocean, west of Lone Mountain. We shall look with considerable interest for a corroboration of the above statement, or for any further developments in that direction.

**BRONZE SHEATHING METAL.**—The yellow sheathing metal, which is so extensively used for coppering vessels, is finished by immersing the sheets, after all rolling is done, in an acid bath. This gives a fine color; but it is now asserted that it is injurious to the metal. The hard and polished surface is removed, and in its place is left a rough and uneven surface, which is, moreover, considerably softer than the other. A microscope makes the first plainly perceptible, and the last is shown by the ease with which it is scratched with a knife. It is believed by some that more injury is done to the metal by the ten minutes immersion in the acid, than would result from six months use in water. The New Bedford Copper Company have secured a patent for their "bronze sheathing" metal, the composition of which is the same with that of the "yellow metal," the sole difference being in the finish of the surface.

CAST IRON is doubly more expansive than wrought iron, and wrought iron doubly more so than steel.

**ROLLING MILLS.**—Prior to 1817, there was not a rolling mill in the United States for bar iron. All the bar iron, not imported, was made by the expensive and tedious process of the forgo hammer. The first rolling mill put up in the United States, was erected in 1816, by T. C. Lewis, for Isaac Mason, Sen., near Connellsville, Penn. It commenced operations in October, 1817. One of the persons who assisted in rolling the first bar of iron at that mill, and the only one of the number now living, recently communicated these facts to the *Pittsburg Commercial*. The first rolling mill at Pittsburg went into operation in 1819; now there are upwards of fifty in that city and vicinity alone.

Judging from the wonderful progress and extent which has been witnessed in the iron interest of this country during the past twenty-five years, and viewed in connection with our resources in that direction, it is difficult to conceive where it will stop or retrograde in its present rate of increase. The iron and coal resources of this country are without parallel in the world, and cannot fail to place the American people at the head of the industrial nations of the earth.

It is well known to our citizens that arrangements are being made to establish a rolling mill on the Potrero, near this city. We understand that a train of rolls, with heavy shears, etc., required for the manufacture of all sizes of iron, also several turning lathes to enable them to do their own machine work, are now on their way thither from the East. Drawings are being prepared for the engines, which will be built in this city. The Pacific Forge Company, near the railroad repair shop, has been consolidated with, and is now operating as a part of the rolling mill establishment. The works, when in full operation, will be fully equal to the necessities of the Pacific coast. We also understand that the company proposes to experiment with California iron ores, with the view of learning the practicability of furnishing our own raw material. Should they succeed in this particular, it will open up a new and important industry on this coast.

**PEAT IRON.**—The *Montreal Gazette* notices the first bloom made in that part of the world with pure peat fuel, and pronounces it of the very highest quality, equal to the best Swedish iron. The bar was bent cold by a vice, and doubled up close at right angles with an edge, without a crack or flaw appearing, the outer corners remaining smooth and sharp; a test which it is said no coal-iron made in Canada will stand. The fact is of great importance to all those countries where coal is scarce; but peat and iron abundant. The peat resources of California are almost unlimited, and the question of their utilization and ultimate value is merely a question of time.

**STEEL RAILS FOR AMERICAN RAILROADS.** Charles Cammell & Co., of Sheffield, Eng., have recently received orders for 28,000 tons of Bessemer steel rails—a large portion of which is for the Erie, New York Central, Boston and Worcester and Boston and Providence railroads. Experience is fast proving the economy of this description over the ordinary iron rail, especially on curves, turn-outs and near depots and other stations where more than ordinary friction comes upon the rails in consequence of frequent stoppages.

**IMPROVEMENT IN IRON PLATING.**—According to the *Engineer*, an internal coating of a mixture of powdered cork and india-rubber has been found such a protection to the plates of iron vessels that when an eight-inch shot was fired through a thickness of one foot of this substance, it closed so tightly that the end of a walking-stick could not be forced into the hole.

**OIL IN CANADA.**—A flowing oil well was recently struck in Enniskillen township, Canada West, the capacity of which is over 600 barrels per day.

## Scientific Miscellany.

## Singular Facts with Regard to Heat.

It is a singular scientific fact, that ice at 32° cannot communicate caloric, by direct contact, to water cooled, as, under certain circumstances, it may be, to a temperature below the freezing point; and that water, under atmospheric pressure, heated, as may be done, to a point above steam heat, cannot communicate caloric to steam which passes through it, at the normal steam heat of 212°.

In the former case, the contact of ice with over cooled water, causes an instantaneous congelation of a part of the water, with a rise in temperature of the balance to 32°; in the latter case, the contact of steam with over heated water causes a sudden ebullition of the water, with a conversion of a portion of the same into steam at 212°, while the balance instantaneously falls back to the same temperature of 212°.

To obtain steam from a saturated solution of common salt and water, the water must be heated, under atmospheric pressure, to 226°; yet the steam which comes off is only 212°. So, also, of other solutions which boil at various degrees of heat above 212°—some of which (as a solution of potash or muriate of lime) require a temperature of 272°, yet emit steam in all cases, under atmospheric pressure, at 212°; except where the substance of the material dissolved, itself enters into the composition of the vapor. In that case, the vapor may pass off at a temperature very nearly or quite equal to that of the boiling mass.

The cause of the first class of phenomena noted, has been referred to molecular conditions and polar influences in the ultimate particles of matter. This explanation, or rather hypothesis, for want of a better, has been generally accepted by modern investigators.

It is easy to conceive, as remarked by a writer in the *Philosophical Magazine*, that the "affinity or attractive influence between the particles of water and those of a dissolved body, should hold down the water particles in close association with the solid particles against the force of heat tending to separate them, and that thus the boiling point of the solution should be raised; but it is not so easy to conceive why the steam-bubbles rising from the bottom of a solution of potash, boiling at 272°, should escape from the surface as saturated steam at 212°, without any indication of having been superheated by contact with the liquid sixty degrees hotter, and through which (it may be for a long distance) it has passed! This latter phenomenon, especially, seems to be completely enveloped in obscurity, and must be classed among the many mysteries of science, the solution of which is still to be sought for.

**TIMBER LAND.**—The best proportion of timber land required for an agricultural country, to secure a regular and sufficient rain-fall without violent storms, is an interesting subject of scientific inquiry. Inestimable benefit would result to the mineral interests of this country, if the proportion could be ascertained and in some way secured by legislation, in each of our several descriptions of territory. The quality, pitch and elevation of the land, with the influence of mountains and seas, as well as climate, are among the conditions to be taken into account. Rentzsch calculates twenty to twenty-three per cent. of forest as necessary in Germany; while five per cent. would suffice for England, and Sir Henry James considers half that portion sufficient.

**MANGANESE.**—One of the richest and perhaps the softest species of black oxide of manganese ore ever found, was discovered in Arkansas, just before the war, by an English proprietor of manganese mines in Germany. This gentleman was induced by a statement of the late geological surveyor of Arkansas to come over and search for a conjectured deposit near Polk's Bayou. It was found in the mountains to the left of Law's Creek, which empties into Polk's Bayou, about two miles from Batesville, and is pronounced by the discoverer superior to any that he had ever worked. There is much of the harder species in Independence county, especially on Lafaty Creek.

**DUE PROPORTION OF CARBON IN ILLUMINATING GAS.**—It is well known that the variable amount of light obtained from illuminating gas is mainly due to the presence of more or less carbon. A French commission was appointed in 1852 to instigate a series of scientific experiments, to ascertain the exact proportion of carbon required in ordinary illuminating gas, to produce the greatest amount of light. Their report was that 27 per cent. of carbon should be present to produce such a result. Gas, deficient in carbon, may have that deficiency, to a certain extent, made up by passing it over or through any of the light hydrocarbons—such as naphtha, etc. More or less carbon will thus be added, according to the volatility or temperature of such hydrocarbons. Various kinds of apparatus have been devised for accomplishing this purpose, which may be set up by the purchaser independent of the company's gas-meter. An important economy in the use of gas is claimed in the employment of some of these machines. A gas, deficient in carbon, is more profitable for the gas manufacturer, who sells by measure, at the expense of quality. Atmospheric air may be admitted into the mains and sold with the gas. Ten per cent. of air may thus be admitted and sold, which mixture will give just as good a light as though the gas was pure; but the register will indicate a corresponding increase in the consumption. It is supposed that this thing has happened in the case of unscrupulous gas companies who have been compelled to decrease their price of gas—they add a per centage of air to the gas, just in proportion to the per centage of reduction in price; thereby actually selling their gas at just the same price which they obtained before the decrease.

**ELECTRICITY FROM A CANDLE.**—Professor Faraday has demonstrated that the electricity evolved from the combustion of a common candle, would, if arranged in a continuous circuit, exceed that of the most powerful battery. The theory is that the heat generated by combustion, is owing to the union of the two electricities—the primitive and negative. If a means could be discovered by which this source of power could be taken off, as from an ordinary galvanic battery, a new career would be thereby opened to science and to mechanics. The same is true of any species of combustion. The coal consumed under a steam boiler produces an amount of electricity, which, if it could be utilized, as from the decomposing action of a battery, and converted into magneto-electricity, would be sufficient to propel a whole fleet, instead of a single boat. This little demonstration of Faraday's opens to our vision a most astonishing field for contemplation and research. Verily, the world moves!

**HEAT OF THE SUN.**—Nearly a century ago, the French naturalist Buffon, and more recently Bischof, made a series of experiments with cast iron balls of varying sizes, and heated to a white heat, seeking to establish some law of relation between size and the time requisite to cool through a certain number of degrees. From the results of these experiments, the conclusion is deduced that millions of years would be required to cool to any perceptible degree a body as large as our sun, if once in a white hot state. As proof of the intense heat of the sun, the spectroscopic shows that substances solid on our earth, such as zinc, sodium, potassium, nickel, copper, and even iron, exist on the surface of the sun, only in the state of vapor.

**TELEGRAMS TO THE SUN.**—The waves of sound go only 377 yards in the second, while the earth itself goes 18½ miles, and light 10,000 times faster than that; while electricity (which is vibration of the solid atoms of bodies, and not a fluid,) runs along the wire about half as fast again as light. So, if the earth were a cannon ball, shot at the sun from its present distance, with the velocity it now travels with, and the moment of explosion telegraphed to the sun, they would get the telegram there in about five minutes, and see the earth coming in about eight minutes, and would have nearly two months to prepare for the blow, which they would receive about fifteen years before they heard the original explosion. This is merely taking the sun as a target to be shot at without regard to his power of attracting the earth at the final of 390 miles a second.

## New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and important inventions; also, the list of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**SHINGLE MACHINE.**—J. P. N. Davis, of Point Arenas, Cal., has recently invented a shingle machine, for sawing, shaving and piling, for which he claims several important advantages, as follows: It is so light as to be easily carried about by four persons, thereby obviating the necessity of hauling to any given locality a large amount of timber which cannot be worked into shingles; it requires but five men to run a machine, which will turn out 30,000 shingles in ten hours; and it is so constructed that it can be easily set to meet different sized bolts. It is said to make an excellent shaved shingle. Application for a patent for the same has been made through the MINING AND SCIENTIFIC PRESS PATENT AGENCY.

**SASH MORTISING MACHINE.**—Mr. G. Kindelberger, of this city, has invented a machine for mortising sashes, which is claimed to be an improvement on the old sash mortising machine. It consists of an iron slide to run upon the bed, as in the old machine, with a regulating, movable pin and lever. By this invention it is claimed that sashes can be mortised without first being marked off; and that an experienced workman can take the sawed strips for sashes and mortise them without any difficulty, while the work can be performed with greater celerity and exactness than it could under the old plan by skilled workmen, even after the sash pieces have been marked off with a square and rule.

**A NEW CONCENTRATOR.**—The Nevada Gazette speaks of a new concentrator recently invented by Justin Mitchell, of that city, which is now being experimented with at the mill of the New York company. The Gazette is informed that the machine is very simple in its construction, that it costs but a trifle, and of the rock on which the experiments were tried it saves about one-fifth the pulp, including all the sulphurets and the heavier portions of the rock which contain the gold. The concentrated tailings are then worked in Mitchell's pans.

## PATENTS RECENTLY ISSUED.

**COMPOSITION FOR PREPARING AND HARDENING WOOD AND PRESERVING THE SAME.** John L. Samuels, San Francisco, Cal.: Mr. S. claims the use of a composition of sulphate of iron, common lime, and water, mixed in certain proportions, for the purpose of being injected into wood and timber, to render the same impervious to the influence of wet and dry rot, and the attacks of worms and insects.

**A GOLD DREDGING AND CONCENTRATING MACHINE.**—John Johnson, of Saco, Maine, has obtained a patent for a "Process of obtaining the precious metals from the beds of rivers," and another for a new "Mode for gathering and treating auriferous sands from the beds of rivers." The former, as described, is substantially that elsewhere noticed, at length, in the present issue, under the head of "A Gold Dredging machine." The latter is a combination with the dredging or pumping apparatus of a certain combination of "separators, concentrators, agitators and amalgamators," to be operated on a barge or elsewhere.

**CYLINDRICAL AMALGAMATOR.**—Thos. M. Fell, New York city, claims the introduction of the alternating sluice or flood motion for obtaining entire suspension and trituration of the mass, accomplished by what we designate a dash or sluice board acting in connection with a vibrating or oscillating cylinder, substantially as set forth, for the purpose of amalgamation of gold and silver ores. Also, the introduction, for the purpose of amalgamation, of an oscillating or vibrating cylinder to which is attached a dash or sluice-board, all substantially in the manner described.

**TEMPERING STEEL SPRINGS.**—Cephas Manning, West Albany, N. Y., claims the use of a combination of linseed oil (raw or boiled) with as much common salt as the oil will take up, for the tempering of steel springs, in the manner described.

**QUARTZ MILL.**—Gilbert D. Jones, New York city, claims adjustable or rising and falling scrapers, and fixed scoopers, arranged and applied to operate substantially in the manner and for the purposes set forth in his specifications on file.

**MOSAIC.**—There are eighty-seven thousand seven hundred and seventy-two pieces of wood in the floor of the new dining room at the Lick House, in this city.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
FEBRUARY 9, 1867.  
MONEY MARKET.

A very marked ease is apparent in the money market, and all demands for business accommodations are freely met by our banking institutions at rates which have ruled for some time past— $1\frac{1}{4}$  @  $\frac{3}{4}$  cent. per month for first class paper, while outside transactions command  $1\frac{1}{2}$  @  $\frac{3}{4}$  cent. in most instances. At present the deposits in our private banks and savings institutions are very large, having been greatly augmented within the past few months. This has been more especially the case since the commencement of the present year, and may be rather more applicable to the increase of deposit receipts by the savings societies than to our other monetary institutions.

The Legal Tender market has been very quiet during the period under review, and sales were mostly effected within a range of  $73\frac{1}{4}$  @  $74\frac{1}{4}$ . In the Board  $30,000$  in Legal Tenders sold at  $73\frac{1}{4}$  @  $73\frac{1}{2}$ , seller 30, and a small amount at  $73\frac{1}{2}$ ; also  $2,000$  in June 7-30's at  $78\frac{1}{2}$  c.

The aggregate sales in the Stock and Exchange Board of Stocks, Bonds and Legal Tender Notes, during the month of January, 1867, amounted to  $\$3,664,322$ ; in January, 1866,  $\$2,727,187$ ; in January, 1865,  $\$1,901,598$ ; and in January, 1864,  $\$3,484,285$ .

The duties paid at the Custom House in this city, from January 1 to February 7, 1867, inclusive, amounted to  $\$613,641.63$ .

## CITY STOCKS.

This class of securities continue quiet so far as public transactions are concerned. During the present week sales in the Board of California Steam Navigation Company were made at  $60\frac{1}{2}$  @  $60\frac{3}{4}$  cent., and National Insurance Company shares at  $74\frac{1}{2}$  @  $73$ , ex-dividend.

## MINING SHARE MARKET.

Since our last reference the stock market has been exceedingly variable, but most leading shares at the close show more strength at enhanced figures. The improved condition of the roads in the State of Nevada, incident to a change in the weather, will, it is thought, remove the recent difficulty experienced in hauling ores to the different mills. So far as late developments are concerned, we hear of nothing specially unfavorable, and much that is of an encouraging nature. Several companies have already announced their dividends for the present month.

**HALE & NORCROSS**—continues to be well held in the hands of a few parties, and rarely makes its appearance in the market. It is nominally quoted at  $\$2,600$  asked.

**SAVAGE**—is in better favor at the close, having declined from  $\$1,960$  to  $\$1,900$ , then steadily advanced to  $\$2,125$ , and closed at  $\$1,915$ , ex-dividend. This company disbursed a dividend of  $\$100$  per foot to its stockholders yesterday, and will carry forward a cash surplus of about  $\$75,000$ . During the week ending February 2d, 1,395 tons of ore were extracted from the mine, showing an assay value of  $\$39.40$  per ton—an improvement of more than  $\$4$  per ton over the assay value of the amount extracted during the previous week. Recent developments in this mine, at a depth of 100 feet in winze No. 2 from the seventh station, prove the continuance of ore to that depth. The cross-cut at that point, it is said, shows eleven feet of fair average ore, and the returns for the present week exhibit a marked improvement in the ore taken from the south mine. The Curtis shaft is now about 50 feet below the seventh station.

**CROWN POINT**—was very irregular during the period under review, opening at  $\$1,075$  advancing to  $\$1,100$ , seller 30, then receding to  $\$1,025$  and  $\$905$ , rallying to  $\$1,000$ , and closing yesterday at  $\$975$ . No material change in the mine. The shaft from the 400-foot level has now attained a depth of 60 feet. During the week ending February

1st, 912 tons of ore were extracted, showing an increase of 158 tons as against the amount raised during the previous week. The bullion returns for the month of January amounted to about  $\$140,000$ , leaving a balance of  $\$110,000$  after paying all expenses.

**YELLOW JACKET**—was largely dealt in during the past week, and at very changeable prices, advancing from  $\$725$  to  $\$900$ , rapidly declining to  $\$715$ , then rising to  $\$770$  @  $795$ , and at the close selling at  $\$800$ . There is said to be some improvement to note in the condition of the south mine; the north mine looks less promising.

**GOULD & CURRY**—has met with more inquiry, declining from  $\$512.50$  to  $\$505$ , improving to  $\$520$  and  $\$580$ , and at the close obtained  $\$560$ . We are informed that this mine looks well, without any change worthy of special mention. The mill is in good running condition.

**CHOLLAR-POTOSI**—shows an improvement from opening prices, advancing from  $\$224$  to  $\$235$ , and closing yesterday at  $\$235$ . The bullion received by this company from crushings during the month of January amounted to about  $\$80,000$ . The breasting recently done 110 feet below the Blue Wing station has developed a large body of ore, which is estimated by the company's surveyor at 20,000 tons of  $\$30$  ore.

**EMPIRE MILL**—advanced from  $\$175$  to  $\$195$ , then sold at  $\$190$ , and at the close  $\$190$  is bid. This company disburses a dividend of  $\$15$  per share to-day; this sum added to the January dividend of  $\$10$ , shows a total distribution of  $\$30,000$  since the first of the present year. It is said that in the old "Red Ledge," on the 250-foot level, a body of ore supposed to contain about 15,000 tons is now in sight.

**IMPERIAL**—sold at enhanced rates during the present week, rising from  $\$164$  to  $\$175$ , and at the close  $\$175$  is asked. The bullion returns for the month of January have been largely in excess of several previous months, aggregating  $\$115,948.67$ , as against  $\$81,045.67$  in the month of December—an increase of  $\$34,903$ . The last clean-up in January produced more than  $\$55,000$  in bullion. This company has a large supply of ore at the Rock Point mill, and about 2,000 tons had accumulated at the dump on the first instant, at which time the hauling of ore was resumed. The Imperial-Empire shaft is now 775 feet in depth.

**OPHIR**—has been dull, a few feet selling at  $\$148$  @  $145$ , closing yesterday at  $\$145$ . The tenth level drift in this mine to the east is in about 40 feet. In the north mine, ninth level, an "upraise" shows, it is said, some favorable indications.

**CONFIDENCE**—declined from  $\$36$  to  $\$26.50$ , improved to  $\$30$ , and at the close sold at  $\$26.50$ . The bullion receipts in January amounted to  $\$22,494.21$ ; in December to  $\$25,978.12$ .

**BELCHER**—advanced from  $\$126$  to  $\$135$ , and closed at  $\$135$ , buyer 30.

**BULLION**—sold within a range of  $\$31$  @  $\$21.50$ , closing at  $\$22$ . ... **OVERMAN** at  $\$26.50$  @  $\$24$ . ... **DANEY** at  $\$4.50$  @  $5$ ; and a large amount of **SIERRA NEVADA** stock at a uniform price of  $\$4$ .

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to  $\$1,012,616$ .

**YELLOW JACKET DECISION.**—A Washington telegram, dated February 4th, says: "By the Supreme Court, to-day, in the Yellow Jacket Washoe mining case, the writ of error was dismissed for want of jurisdiction, which leaves the original judgment of the Supreme Court of Nevada undisturbed." This settles the title to 240 feet of mining ground, worth over  $\$200,000$ , claimed by the company, who hold under the first purchasers from the attorney-in-fact of the original owner of the ground.

**PROF. BLAKE'S** Lecture on Japan, before the Lincoln Lyceum at Oakland, on Thursday of last week, was listened to with great attention by a very large and appreciative audience.

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

**TO COPPER SMELTERS.**—Any person desirous of securing the services of an experienced copper smelter, will do well to notice an advertisement in the present issue, headed "To Owners of Copper Mines and Smelting Works." The advertiser has had some twenty years experience in copper smelting establishments at the East.

**CALIFORNIA LEATHER AT THE EAST.**—The steamer of January 30th, hence for Panama, carried one hundred sides of sole leather from the tannery of Wagner Bros. of Stockton. The firm in Massachusetts to which it is consigned, say there is no better leather made in the United States.

**GASTON'S SCREW AMALGAMATORS.**—One of these pans was shipped, a few days since, for the Guadalupe and Sacramento Company, Mexico. Their works are about sixty miles east of Mazatlan.

**PACIFIC HYGIENIC HOME WATER CURE**, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated), B. J. SMITH, M. D., Consulting Physician; R. S. MACRETH, M. D., Attending Physician; W. G. W. HARFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-tr

**OLNEY & Co.**, Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. no10

**NATURAL CURIOSITIES FOR CHRISTMAS.**—At No. 522 Pine street, E. F. LORQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell and Wax Flowers, besides Feathers, Birds and Butterflies, larval plants, Shells, Sea-weeds, etc. 24v13-qr

**Air Pump for Sale.**—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 522 Montgomery street. 24v13-9p

## OUR NEW YORK AGENCY.

Mr. GEO. M. NEWTON is our authorized agent in New York City, and will receive advertisements and subscriptions for the MINING AND SCIENTIFIC PRESS at regular rates. Sample copies of our weekly and monthly issues can be procured by calling upon him, at the office of the "STOCKHOLDER," No. 72 William street.

### SALES OF THE WEEK

BY THE N. Y. STOCK & EXCHANGE BOARD

Monday, February 4.

Valuable Books on Mining, Mineralogy, Geology, Metallurgy, Etc.

ANSTED'S Gold Seekers Manual. 1 vol. \$ 1 75  
12mo. cloth.

ANTISELL.—The Manufacture of Photo-  
genie or Hydro-Carbon Oils, from Coal and other  
Bituminous Substances, capable of supplying Burn-  
ing Fluids. By Thomas Antsell, M. D. 3 vol. 8vo. 5 00

BUCKLAND (Rev. Wm.)—Geology and  
Mineralogy. 2 vols. 8vo. cloth. 10 00

CONGDON.—Mining Laws and Forms of Cali-  
fornia and Nevada, and the Mining Ordinances of Mexico.  
184 pp. 8vo; flexible cloth; 1864. (The only compilation  
extant. 2 50

DUFRENOY.—Mineralogie. 5 volumes, 20 00  
8vo.

DANA'S Manual of Mineralogy. Revised  
edition. 260 Illustrations. 12mo. cloth. New Haven,  
1863. School Edition. 2 25

DANA'S Manual of Geology. Numerous Il-  
lustrations. 8vo. half morocco. Philadelphia, 1863. 5 75

DANA'S Text-Book of Geology. Illustrated.  
12mo. cloth. Philadelphia, 1861. 2 25

ELDERHORST'S Blowpipe.—Analysis and  
Determinative Mineralogy. Third edition, revised.  
8vo. cloth. Philadelphia, 1866. 1 50

FAIRBAIRN.—Iron: its History, proper-  
ties, and Processes of Manufacture. By Wm. Fair-  
bairn, C. E., LL. D. 1 vol. 8vo. New Edition. 4 00

FEUTCHWANGER.—A Treatise on Gems.  
1 vol. 8vo. cloth. 1 75

GOODYEAR'S Translation. A Treatise on  
the Assaying of Copper, Silver, Lead, Gold and Mer-  
cury, from the German of Th. Bodenian and Bruuo  
Kerl. 1 vol. 12mo. cloth. 2 50

HUMBLE.—Dictionary of Geology and Min-  
eralogy. Third Edition, Revised 1 vol. 8vo. cloth. 9 00

HOSKOLD'S Practical Treatise on Mining  
Land and Railway Surveying, Engineering, Etc.  
1 vol. 8vo. cloth. 16 00

KUSTEL.—Nevada and California Processes  
of Silver and Gold Extraction, for general use,  
and especially for the Mining Public of California and  
Nevada; also a description of the General Metallur-  
gy of Silver Ores. By Guido Kustel, Mining Engi-  
neer. Illustrated by accurate engraving. 1 vol.  
8vo. cloth. 5 00

LAMBORN.—Rudimental Treatise on the  
Metallurgy of Copper. 1 vol. 12mo. limp cloth.  
Illustrated. 1 00

LAMBORN.—Rudimentary Treatise on the  
Metallurgy of Silver and Lead. 1 vol. 12mo. limp  
cloth. Illustrated. 1 00

MITCHELL'S Manual of Practical Assay-  
ing. 1 vol. 8vo. cloth. 10 50

MAKINS.—A Manual of Metallurgy, more  
particularly of the Precious Metals, including the  
Nevada and Assay descriptions. By J. H. Makins. 1 vol.  
12mo. cloth. Illustrated by upwards of 50 engrav-  
ings. 3 50

OVERMAN (Fred.)—A Treatise on Metal-  
lurgy; comprising Mining, and General and Par-  
ticular Metallurgical Operations. 1 vol. 8vo. cloth. 7 50

PIGGOT.—The Chemistry and Metallurgy  
of Copper. By A. Snowden Piggot, M. D. 1 vol.  
12mo. cloth. 2 00

PHILLIPS AND DARLINGTON.—Records  
of Mining and Metallurgy, or Facts and Memo-

NITRO-GLYCERINE.—Mr. Swanson is at  
Smartsville, Yuba county, testing the use of  
Nobel's blasting oil for running bedrock  
tunnels in the claim of the Blue Point  
Gravel Mining company.

GOSNELL & Co.'s London invention, for  
brushing hair by machinery, has found its  
way to San Francisco.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Amador County.

The *Ledger* of February 2d says: In speaking of the Crafts mine, last week, we should have said that the ore worked by Ambler & Co. paid \$470 to the ton.

## Calaveras County.

From the *Chronicle* of February 2d: We were shown, this week, the result of an analysis of some silver ore taken from the Montgomery claim, Humboldt district. It assayed \$200 per ton in silver, with a slight trace of gold.

Mr. Reynolds, of the Pine Peak claim, at Railroad Flat, showed us some of the richest specimens of quartz rock from that mine that we have ever seen. The ledge, at the depth of fifty feet, is two feet in width, and it increases in size as the shaft is sunk.

Letter from San Andreas to same: The quartz mill of Tubbs & Co. has been removed; it is, however, asserted that the lode has not been fairly tried, and other parties will give the lead another trial. The quartz mill of J. McGlenn & Co. has discontinued labor; another lode near Prospect Hill, had about five tons crushed which proved worthless, paying about one dollar and a half to the ton. The "Everlasting" is laying idle. There is some good quartz here. One lot of fifteen tons paid in the mill at Lower Calaveritas ten dollars per ton. Parties from Chile Gulch have paid for developing this mine so far. The Willow Creek lode has been lost by injudicious or ignorant working. Ten tons of this rock paid about seven dollars per ton, but it is asserted that about four hundred dollars worth of gold specimens had been carried off during the excitement. Adams & Co. have also quit work. The vein of Ritter & Co. needs another trial. The Sandy lode is an extension. The Union mine has been worked to water level, 150 feet, and the quartz extracted has paid about fifteen dollars per ton, on the average; some capitalists will some day follow downward this mine, and be well paid for so doing. The vein is from one to four feet wide. Bachman's claim, at Fourth Crossing, is on the same lode as the former, and the owner is working singly and doing well with a hand-mortal. Thorpe & Co's lode is believed to be as good as the old Winter lode at Angels; its appearance and prospects are very good. Wood & Co's mine, on Dry Creek, is a large one, but it is standing still. To the east of these lodes there has been much prospecting in quartz. In El Dorado, a wide lode is paying four dollars per ton on an average; another vein above Tunnel Hill, on the San Antonio ridge, has been worked with flattering prospects, but is idle at present. Another lode on Indian Creek, above Davis' ranch, is owned by Mexicans who recently crushed ten tons of rock in Lower Calaveritas—yield not known. The lode is from two to five feet in width, the quartz is rich and easily extracted. On the San Domingo the Fair Play has a good reputation; ore crushed by arrastras and has yielded well. Between this and Murphy's camp quite a number of quartz veins have been discovered which prospect well. Dan McKay & Co. had twenty tons of their quartz crushed, which yielded seventy-five dollars per ton. The gold is finely diffused in all the quartz; the vein is two feet wide, the shaft seventy feet down, slate for walls, quartz easily extracted. Many other claims adjoining prospect equally as well, of from one to four feet in width, veins traceable for a long distance. Chilenos and Mexicans have discovered and prospected most of the veins around Murphy's, and a custom mill would be a good thing.

From the *Copperopolis Courier* of January 26th: We were shown, a few days since, a quantity of gold dust taken from Christian Gulch, about two and a half miles from this place, among which was a nugget of gold weighing 14½ ounces. "Dixie" has also struck it big in his claim on Rock Creek. One piece found by him last week was worth \$10.50.

## El Dorado County.

From the *Placerville Courier* of Feb. 2d: We learn that the second south extension of the Pacific ledge was discovered and located a few days since on the south side of Weber Creek, by parties who have been prospecting for it for seven months. What is still better, it is wide, well defined, and prospects rich. Indications point strongly in the direction of lively times throughout El Dorado county. The gravel deposits will pay for years to come. In this connection, we learn that a San Francisco foundry firm closed a contract this week, on a claim near the head of Cedar Ravine, for a one-half interest.

Georgetown correspondence of same says that as soon as the roads are in good condition for the transportation of heavy machinery, times will be lively in that region.

Nitro-glycerine is to be tried for blasting bedrock about Georgetown.

## Mariposa County.

From the *Gazette* of Feb. 2d: In Hunter's Valley, the Potts mine is turning out richer ore than ever before. The last clean up of about eighty tons yielded as high as \$54 per ton. The mine is 120 feet deep. The number of men working there at present is only twenty-two.

The Floyd mill is stopped for want of wood. The Barrett mill has also been motionless for some time, owing to a scarcity of quartz, which it is found quite impracticable to haul, just now.

We regret to learn that the La Victoire Copper Mining Company have suspended operations. The mine was making water very fast. We understand that the company have now under consideration the subject of selling the mine, as it stands, with all machinery and appurtenances belonging thereto.

The Lafayette mill is also stopped, for a while, on account of scarcity of wood and too much water in the mine.

This valley will take a start in a few months hence under better auspices than ever. Another quartz mill is to be erected on the Potts mine.

Wm. R. Carson, some time last week, found a pure nugget of gold, weighing about four pounds.

## Nevada County.

From the *Gazette* of January 28th: The Allison Ranch company are putting up a number of the Norton pans, for the purpose of working the tailings that have been accumulating at their mill for several years. It is expected that the tailings will yield a large amount of gold. We learn that forty pounds of amalgam was cleaned up at the Banner mill, last week, after four days run.

Same of 30th: The Birchville company have struck a rich quartz ledge near the town of Eureka. The company has run a tunnel one hundred and fifty feet, striking the ledge a few days ago, finding the rock remarkably rich, and the ledge of good size.

Same of February 1st: Mallory & Co., of You Bet, had a splendid clean-up from their cement mill this week. The company are in high spirits over their prospects. Brown Brothers made a brick of \$2,100, the result of five days crushing of cement.

February 2d: Mines are lively at North San Juan. Water for the miners is abundant, and more companies are at work in the vicinity of the town than at any time for some years back. Nearly all are doing well, and it is expected that the gold yield of the township for the present season will considerably exceed that of last year.

From the *Transcript* of January 29th: The company owning the extension of the Star Spangled Banner mine have a large lot of rock on the surface, and we understand that Stiles' mill will commence crushing on this rock as soon as it is repaired. The rock in the extension resembles very much that taken at the same depth from the Banner mine.

The excellent hoisting works recently completed on the Whigham lead are working beautifully, and the mine still yields first-rate rock. A mill has been contracted for.

The California mill is nearly ready for work. The battery has ten 750-pound stamps. The pulp is run into Atwood's agitators, over Hungarian rifles and copper plates, a distance of twenty-eight feet, when it is dropped upon Bradford's separators. No pans will be used in the mill. It is expected that the mill will be ready for work in about ten days.

Letter to same from North Bloomfield, January 28th, says: The N. B. Gravel Mining company have worked with indefatigable energy. They have now about 700 feet of their main flume built. Its size is six feet wide and two feet deep. They have about eighty feet of their tunnel run. They have, also, by running a smaller tunnel, opened out one set of claims and made one run with good success, clearing some two thousand dollars.

C. Kniff has fitted up the old Pettijean diggings. He also made one run and cleaned up well, making five dollars per day to the hand.

R. C. Black has just cleaned up the snug little sum of eleven hundred dollars for eight days run.

The Jenny Lind company have been washing three or four days, but on account of the present heavy fall of snow have suspended operations for a time.

Same of 30th: The incline on the Cunningham mine is now down 150 feet. The ledge is two feet wide, and increasing.

Same of Feb. 2d: Among the companies

at San Juan who have started work are the Star, Ohio, Wyoming and Golden Gate. The New England Company is a new one.

The Empire Company at Kate Hays Flat, near French Corral, after their usual run, cleaned up a few days ago, and took out between eleven and twelve thousand dollars.

At Eureka, the Golden Age Company recently struck a ledge which promises well. The mill of the Jim Company is not running at present. They are running a main tunnel, and prospects are good.

Same of 5th: In Little York township, Mallory & Co., Heydliff and Collins, have made rich strikes in their cement claims, and are increasing the number of hands employed. Neece & West are also at work and have first-rate cement. The South Yuba hydraulic claims are being worked, but have not yet cleaned up. Many other gravel claims are being worked with good returns. Some attention is also being paid to the development of quartz mines. Work was resumed on the Aurora lead on Monday last. Sixteen pounds of rock from a depth of thirty feet paid \$3.70 in gold.

From the *Grass Valley Union* of January 29th: The new pump of the Cambridge Company works to a charm.

The ore now being taken from the Lucky mine is as rich as anything ever seen in this vicinity.

EXCELSIOR.—The Meadow Lake *Sun* of Feb. 2d, says: The Golden Eagle Company's mill will start up on Monday noon, Feb. 4th. It is one of the most convenient and best constructed mills in the district.

## Placer County.

From the *Stars and Stripes* of Jan. 30th: The Dardenelles claim near Forest Hill, which has been successfully worked for a long series of years, is now being operated on a large scale. A "face" of nearly two hundred feet in height, by over eight hundred in breadth, is subjected to the action of three hydraulic pipes and the auriferous gravel is being moved by acres. We understand that this claim has never been in so good condition as at present.

On Red Ravine, a short distance above Opbir, the 5-stamp quartz mill recently erected by Mr. G. F. Hartwell, Assistant Superintendent of the C. P. R. R. went into operation on Thursday last, and we understand that it works most satisfactorily.

Rich specimens of "float" are often met with in this vicinity. Several parties are engaged in gathering together conveniently for crushing, heaps of the detached and scattered fragments of quartz rock, of which comparatively exhaustless quantities are found "lying round loose." We are informed that one company near here has already gathered up no less than 400 tons and has a large number of hands employed collecting more.

The Columbia's Pride Company had 26½ tons of rock crushed at the Stewart's Flat mill, which yielded about \$28 per ton. The rock has laid on the ground through all the rain for two or three months, and has been handled so much that there was a great deal of dirt and water mixed with it. They had everything crushed—surface rock and all—and as soon as the weather permits, it will be worked night and day.

Same of February 6th: Captain Mallett has his new cement mill on Badger Ravine, near Gold Hill, nearly completed and ready for operations. It would have been working ere this, but for detention of a few articles of necessary machinery en route from below.

The Wells company, near Bald Hill, have over one hundred tons of rock out ready for shipment to the Ophir mill whenever the roads get in condition. The last rock crushed from this lead yielded \$17.50 per ton. The greater proportion of that now on hand appears much richer than the last crushing.

The Oro mine, adjoining the celebrated Dardenelles claim, is now being actively worked. There is a fine 20-stamp mill on the Oro, through which the cement is being worked in large quantity. A pan for crushing and grinding sulphurets is being set up, and will be in operation in a few days.

From the *Dutch Flat Enquirer* of January 30th: Last week the large iron pipe laid down last fall at a considerable expense by the Dutch Flat Water Company, burst from the great strain caused by the pressure, the pipe being quite full. The Yuba Ditch, which conveys the waters of the South Yuba to the miners at Gold Run and vicinity, continues right side up.

## Shasta County.

From the *Courier* of Jan. 26th: William Logan, just down from Dog Creek, states that the miners on that stream are realizing good pay this winter, although the heavy storms have to some extent interfered with their operations. Ismon & Baylis own a good bar claim, and have nearly completed a self-discharging reservoir.

The rains have increased the facilities for working the bars on Flat Creek. The experience of the Brumfield brothers has demonstrated that the high bars along the creek will pay if properly worked.

Same of Feb. 2d: E. F. Crocker, whose experience entitles his opinions to consideration, thinks that the quartz ledges on Whiskey Creek show more evidence of richness and permanency, than any other series of ledges he has examined in the county. The ledges are generally very wide, well defined, and prospect in free gold from the top to the bottom of every shaft.

Last week a couple of miners concluded to test some of the rock from a ledge of decomposed quartz near Farrington's mill, on Brandy Creek, and after reducing several pounds of the croppings in a common hand mortar, cleaned up thirty-seven dollars.

Copper City is now almost deserted, work is entirely suspended on all the quartz claims, and but six or seven men remain in the place. Two years ago it contained a population of two or three hundred.

From the *Red Bluff Independent* of Jan. 30th: Within a day's ride of this place is a mining camp, comparatively insignificant at present, but promising to rival the famed Comstock ledge in richness, if not in quantity of ore. The silver mines of Shasta county, located on the south fork of Clear Creek, are as yet comparatively undeveloped, but so far the attention of capitalists has been withdrawn in other quarters. The indications are, that as soon as the wet weather subsides and travel becomes easy, a large number of San Francisco capitalists will visit these mines. \* \* The Shasta silver mines possess great and manifold advantages over those of Virginia City, a few of which may be briefly enumerated. The first is water power, which never fails, thus avoiding the first cost of steam machinery, as well as the wear and tear of boilers. Second, the abundance of wood for suitable fuel to roast the ores. Last, is the proximity of good farming land, enabling the miners to procure supplies of all kinds at least forty per cent. lower than in Virginia City.

## Sierra County.

From the *Downieville Messenger* of Feb. 2d: The Good Hope company has let a contract to run a new tunnel to prospect their ledge lower down. The contractors have already reached the ledge, and are now breasting out rock.

The Slug Cañon Quartz mill, which was temporarily stopped on account of snow filling up the flume and clogging the wheels, is again in running order, and crushing its usual amount of rock with flattering prospects. Every pound of rock taken out prospects immensely.

We visited the Vienna, a few days since, and took a hand in prospecting some of the rock. It was impossible to find a piece of rock that did not yield a fine prospect, while in almost any part of the ledge free gold could be seen. The mineral is in about twenty feet. The ledge is about four feet wide.

Letter to same from Poverty Hill says: Thomas Hawkins has sold one-half his diggings to the Messrs. Kingdon, of Secret Diggings, for eight thousand dollars.

## Tulare County.

The *Visalia Delta* of January 30th says: This important branch of industry was never so prosperous in this part of the State as at present. Prospectors are discovering new lodes in all directions, while the old discoveries are being worked with increased vigor and success. A little time, and a little more capital is all we need to make this the leading mining region of the State.

## Yuba County.

From the *North Californian* of February 4th: The Pennsylvania Mining company made a clean-up yesterday—the neat little sum of between ten and eleven thousand dollars was taken out.

Letter from Camptenville to the *Messenger* of February 2d: We have been not less favored than the rest of the State with copious rains, and of course water is more than plenty, and still times are dull. B. P. Hogg & Co. have their tunnel nearly completed, and will resume washing in a few weeks.

## ARIZONA.

From the *Miner* of Jan. 12th: The clean up of the Dividend, at Big Bug, has just been reported. The result is \$40 per ton. The working was done at the Borger mill.

Connected with the Borger mill at Big Bug are several furnaces, now in successful operation.

A letter from W. Thompson, superintendent of the Springfield Company, at Williams' Fork copper mine, gives a most encouraging account of prospects there. Messrs. Spaulding, Bickle, Buchanan and Lake, of Lynx Creek, have constructed a

wagon road a couple of miles long, dug an excellent ditch for water power, built a 20-foot water wheel and arastra, and are now engaged in grinding rock.

#### COLORADO.

A letter from Red Mountain to the *Denver News* of Jan. 16th, has the following: That these mines are rich, there is no longer any doubt. The veins that have been developed to the depth of from ten to twenty feet show a continuous vein of ore that assays very rich. The lodes of this region must be very rich, as fine gold is found all over the valleys and in all the little ravines in the surface soil. The placer diggings of Lake county are unrivaled. The gold taken from all of them shows unmistakable evidence of its origin in the lodes.

Cash Creek Park correspondent says: Cash Creek Park, literally speaking, is one vast placer gold mine. It is almost impossible to find a single pan of dirt on the most elevated portions of the Park, that will not yield from one to half a dozen colors of gold, while all the principal gulches and small ravines that traverse it, are rich placer diggings.

Cash Creek Gulch has been mined for seven years with success, and now bids fair to become one of the most prolific gold mines in Colorado. Large amounts of gold have been taken from the banks on either side of the gulch. Gold Run and Richie's patch diggings have paid, so far, remarkable well. The Richie patch mine has been and is yet extraordinarily productive. Hundreds of nuggets have been picked up in the pit that weighed from two to sixty dollars of wire gold, and of great fineness. The diggings are shallow; the bedrock lying from two to five feet below the surface. Gibson Gulch is rich, yielding from five to fifteen cents to the pan.

Yuba Gulch, first above Gihson, bids fair to pay well. Long's Gulch, just above Yuba, prospects fairly with the pan. It is very long and will be easy to work for the reason that any amount of water can be brought to it at small expense.

#### IDAHO.

From the *Owyhee Avalanche* of Jan. 19th: We have good authority for saying that uncommonly rich ore is now being taken from the Whisky Gulch mine, and that the miners have thirty or forty tons ahead of their contract for the Shoenbar mill.

The value of bullion and gold dust shipped by Wells, Fargo & Co., from their office in Ruby City, for the year ending December 31st, was a little more than \$750,000.

An Idaho letter to the *Times* of Jan. 31st, says: It will be two years at least ere the mills—with the best management—now erected in Idaho, will find steady employment; and thus far the operations have been characterized by the most verdant manipulations—considering the amount of capital expended and the general result. That the best of mineral-bearing veins exist in this Territory, and in abundance, none who have visited it with a view to investment, pretend to deny.

A new county called Lemhi, has been created in Northern Idaho. This is the Salmon River region.

A letter to the *Montana Post*, dated Grantsville, Dec. 30th, has these items: A new gulch has been discovered by Messrs. Buckhart & Co., who have organized a new district called "Welfoot." The gulch is about three miles long, and prospects twelve cents to the pan wherever a hole has been sunk. We have good news from Rapp's Gulch. Messrs. Pope, Moore & Co. have washed out of fifteen pans \$34.20 of as pretty, coarse gold as a man need look at, and out of one hundred and sixty pans of dirt taken off the gravel above the bedrock, got \$48, making an average of twenty cents per pan. Among the lucky owners of ground in this gulch are Messrs. J. A. Cook and R. T. Harris & Company.

During the last week gold was discovered in Eureka Hill, above the main creek. The discoverers say it prospects from five to twenty cents through eight feet of gravel.

Letter to the *Virginia Enterprise* says of these mines: Salmon River diggings are still being talked of and loudly. Every one seems to be of the opinion that they are the "richest yet discovered," and consequently great preparations are being made for a grand rush so soon as the roads will permit. Even now, every day, over the snow they go, to the new El Dorado.

#### MONTANA.

From the *Post* of Jan. 12th: Mr. Hendrie's 20-stamp quartz mill, located in New York Gulch, will commence operations on next Monday. For the present, however, but ten stamps will be used, they being all the owner has now on hand.

One hundred and fifty claims were taken up in Wisconsin Gulch at the late stampede. On No. 2 west, on the Whitlatch Union

lode, Professor Hodge, superintendent and agent of the New York Gold and Silver Exploring and Mining Company, is now working some forty men, is down over 100 feet, and taking out some splendid-looking rock. Whitlatch, on No. 3 west, on the same lode, has about thirty-five men at work "breasting out" on the incline and running the side drifts; they also continue to take out rich ore. Work is also being done on some of the other lodes, but by far the greater portion is at present put on the Union. Judge Turnley's mill has, up to the present time, made five separate runs, averaging eighty-one tons of rock at each, or a total of four hundred and five tons of ore crushed, which has yielded in round numbers the sum of \$26,000, being an average per ton of \$64.19, and lacks but a fraction of being the even twenty cents. The last clean-up made from this mill was on last Friday, and was \$6,000 from ninety-five tons of ore, or an average per ton of \$63.15.

Bush's mill, on the Lucas lode, made a clean-up of four and a half day's run, last week, which panned out \$850; an average of \$30 per ton. Colonel Postlewait has taken out of the Kearsarge lode over three hundred tons of quartz. His mill is progressing rapidly toward completion, and will be in complete running order inside of a fortnight.

#### MEXICO.

Some very rich ores from the Patrocinia and Dolores mine in Chihuahua, recently arrived by steamer in this city.

A letter to the *Bulletin* from La Paz, Lower California, thus speaks of the Triunfo mine near San Antonio: "I have seen enough to satisfy me that the Triunfo Company have as much metal in view now as was ever seen at once in all the openings in the Comstock vein. Let those who are inclined to sneer withhold judgment two or three months, and then, if they are not convinced by substantial proofs, I am willing to acknowledge myself mistaken. The Triunfo Company has seven mines situated on two parallel veins. Of these two are now producing ore in large quantities, and there are now over 1,100 tons awaiting the completion of the mill. Before you receive this, the mill will be running with a working capacity of about twenty tons per day. The method of reducing the ore adopted here has already been used successfully in a 10-stamp mill, but the capacity of that mill not being sufficient, one of twenty-four stamps has been put up by Mr. Brooks, the agent of the company, and as soon as the quicksilver is received by the steamer, now due, you will hear their results. Two other mines, worked by a Mexican company are in full operation, and a cargo of ore from them is now lying in the harbor. One of these mines has been worked successfully for nine or ten years past, but inasmuch as no Americans are interested, and none of the ore ever passes through San Francisco, little is known of them there."

#### NEW MEXICO.

The *St. Louis Democrat* of Jan. 11th, says: Dr. Steck, of the Placer Mining Company of New Mexico, arrived on Friday last with a considerable amount of gold dust. He left an order for a 10-stamp mill. It is said that the quartz of the Placer Mountain about thirty miles from Santa Fe, turns out some \$300 per cord. With a small 5-stamp mill, Dr. S. extracted two hundred ounces in the space of two months. These mines have been worked, at times, for some 150 years. The present association is the result of efforts commenced five or six years ago, to establish a company for the re-opening of the old works. Other lodes have recently been discovered in a westerly direction from this point, which give evidence of richness.

#### NEVADA.

##### Black Rock.

From the *Nevada Gazette* of Jan. 30th: Capt. Frank Coffey writes to a friend in Sweetland on the 11th inst., that he and his partner own 6,000 feet of ledges, in which there is rock enough in sight to keep fifty mills running for fifty years, and assays made of the rock yield from \$2,000 to \$7,000 a ton. He says the mines are mostly owned by Honey Lake men, but the owners have no idea of their value. Parties representing Virginia City operators are buying up all the choice claims.

##### Humboldt.

From the *Register* of Jan. 26th: Reports concerning the Agamemnon ledge are conflicting. The boys at work in the tunnel think it is not the main vein, but only large feeders that have been struck; and the croppings below the shaft would seem to make good this belief. The water has not receded in the shaft, as it would likely do if the ledge had been tapped within eight feet of it. The mineral is a sulphuret of silver, copper and lead, and very rich.

Operations have been suspended for a few

days at the Trinity and Sacramento Company's works in Oreana. Nason is enlarging the works—making additions to the mill, extending the building over the old furnaces and erecting new ones. He has a new cupel furnace nearly finished and much larger than the one now in use, which will enable him to cupel ore as fast as it can at present be smelted. Improvements will be completed next week, when work will be resumed with increased energy.

Torrey, who for the past year and a half has been chief of the Manitowoc mine, is now at work in the Pioneer mill, cleaning up his last crushing, before commencing active work on his smelting furnaces in Arabia.

The Nevada mill, the best in Humboldt, and excelled by few in the State, lies idle for want of good management, certainly not for lack of good ore in that vicinity. A perpendicular shaft about 120 feet deep, on the Moutana ledge, failed to prove the mine a "Comstock." The average yield of ore as taken from the shaft, is only \$30 per ton, so the work has stopped and their fine mill has become dead property for the present. No drifts were run in this mine—nothing done to prove it, save the one shaft above mentioned. Webber hauled ore from the Montezuma mine, eight miles, up hill, to his mill in Trinity Cañon, and made it pay well, both for himself and the mine owners. The Wheeler, Daisy, Savannah, and several others from which abundance of ore can easily be extracted, are believed to be far above the average of good paying mines. Workmen on the Wheeler have 300 tons of ore extracted, ready for smelting, and taking out more daily. This ore has been proved by working tests, and the results show a margin for handsome profits.

##### Pahranaagat.

From the *Salt Lake Vedette* of Jan. 26th: Messrs. Crippen and Raymond arrived on Thursday from the Pahranaagat mines. The latter, as the representative of Eastern capitalists, has invested largely. Mr. Ely accompanied the party, he having sold out his interest for \$55,000. These gentlemen say that the results far exceed their most sanguine expectations. On the other side, we learn that Dr. Conger is not so sanguine, his operations not being so successful as the others, but it was in consequence of the failure in his smelting operations. There is sufficient evidence, however, that next spring there will be an extensive emigration to Pahranaagat, and the mines throughout Utah.

##### Reese River.

From the *Reveille* of Jan. 21st: The Ural Silver Mining Company are getting out some splendid ore from the Gould & Curry lode, Mammoth district, which will probably work \$120 per ton. Work continues on the American Flag with good results. Its incline shaft is 123 feet deep, and the ledge of nine feet, formerly much broken, is now compact. The Uncle Sam continues to yield excellent quartz. Work has been suspended on the shaft of the Mount Vernon Company for the last few weeks, but it will be resumed early the coming month. The levels have been pushed steadily, however, and a force has been employed to run a level north on the ledge cut by the tunnel.

The Consolidation Company's mill, Hot Creek, now works well. The stamps are light, and the capacity rated at four tons per day. There are no furnaces, and the ore is treated "raw." Three-quarters of a ton from Reveille district yielded at the rate of \$80 per ton.

Same of 24th gives a list of forty-seven mines which have produced bullion during the quarter ending Dec. 31st, compiled from the books of the County Assessor. We give the average yield per ton of a few of these mines: The Washington, \$419.52; Chase, \$405.10; Magnolia, \$338.23; Buel North Star, \$336.31; Semanthe, \$332.52.

The machinery of the 5-stamp mill is being erected in Reveille district for the Rutland and R. R. Company. The Fisherman ledge is yielding splendid mineral, and our informant states that the owners were asked what they would take for a certain lot of ore—estimated from six to seven tons; and they replied, after a moment's deliberation, that they would "not sell the lot for less than six bits a pound."

Same of 25th: The Child and Canfield ledge, Silver Bend district, has been traced on the surface nearly the entire extent of the claim, and in several excavations it is developed palpably and beautifully. In one of these cuts the ledge is five feet thick, exhibiting a handsome face of mineral.

Same of 30th: Yesterday Colonel Buel arrived in town with \$1,185 worth of bullion from his mill at Belmont. We are informed by the Colonel that this amount is the product of four and a half day's run of nine stamps, and that in eleven and a half

days, with the same number of stamps, the mill produced the large sum of \$13,200.

Same of 31st: Six bars of bullion, valued at \$5,500, arrived yesterday from the mill of the Twin River Company.

Same of Feb. 1st: Rich developments in the tunnel of the Combination Company are reported from Silver Bend. The tunnel is run to cut the Highbridge at the depth of ninety feet from the surface. It has been pushed in to the extent of 158 feet, at which point the ledge has been struck fourteen feet thick.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of January 29th: The new shaft of the Imperial and Empire Companies is now 765 feet deep, and rapid progress being made in sinking deeper. The water troubles but little, and it is proposed to sink the shaft to the depth of 900 feet, and from that point drift to the ledge.

The old whim of the Bajazette and Golden Era Company is being fixed up and put in order for work. It is now the property of the Chollar-Potosi Company, and will be used in the extraction of ore from the upper levels of their mine.

The dumps of all the working mines are full to overflowing, especially in Gold Hill, on account of the almost impassable state of the roads, rendering hauling to the mills nearly out of the question. In consequence of this a large proportion of the mills, both in this and Lyon counties, have had to suspend operations entirely. The Rock Point mill, on Carson river, belonging to the Imperial Mining Company, is still crushing away uninterruptedly at the rate of over 100 tons per day, with plenty of ore on hand.

Same of 31st: The sinking of the Bonner shaft of the Gould & Curry Company, which was re-commenced a short time since, is progressing finely. It is now some 750 feet deep. At the depth of 900 feet it is calculated that the ledge will be cut. The shafts of the Savage, Chollar-Potosi, Hale & Norcross and the Imperial and Empire are also all being energetically sunk.

We saw yesterday a piece of rock from the Palmer ledge which looked very well indeed. The drift is in some fifteen or twenty feet from the shaft.

Same of Feb. 2d: The contract for sinking an incline in the Bowers & Plate mine, Gold Hill, is completed. The incline is a double one, a hundred feet in length, from top to bottom, very substantially timbered throughout, and machinery is about being erected near by for hoisting ore through it.

Two compartments of the Yellow Jacket new shaft are being sunk a hundred feet deeper in order to open a fourth level.

All our mills which have had to suspend operations in the crushing line from lack of the necessary supply of ore, are taking advantage of the opportunity to clean boilers, repair machinery, etc., and put everything in the best running order, ready against the roads get good and the hauling of ore progresses again.

Same of 3d: The McMeans & Devine Gold and Silver Mining Company, encouraged by recent developments, are arranging to commence work again. This claim contains 800 feet, and is situated east of the Jefferson and west of the El Dorado tunnel. Their shaft is eighty-five feet deep, from which one drift forty feet in length has been run, and another one ten or twelve feet.

The *Eastern Slope* says some important sales of Peavine mining interests have lately transpired in New York and Boston. A New York company have purchased the Defiance, Sawyer and Occidental lodes, and the Orient Tunnel Company's mine on the Great Eastern or Jackson lode, for the aggregate sum of \$80,000—currency. The Copper King and Deposit lodes were purchased by a Boston company—represented by Mr. Fessenden, a brother of Senator Fessenden of Maine, for \$18,000—coin. An assay of Bay State ore just returned from Swansea, is as follows: Copper 55½ per cent.; silver, 74 ounces per ton; gold, one ounce per ton.

A MEERSCHAUM PIPE, said to be 300 years old, was sold the other day in Chicago at auction for \$100. It would hold about a tea-cup full of tobacco. It found its way to this country via Lola Montez, who coaxed it out of the old king of Bavaria.

CALIFORNIA mushrooms are said to excel all others in size and flavor. They are abundant near Santa Barbara, but could not be brought to San Francisco while fresh, at least by the conveyances at present available.

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1866.  
Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.  
San Francisco, Jan 11th, 1866.Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.  
Mr. S. B. Whitaker, is our authorized Travelling Agent and Solicitor from this date. Jan. 1, 1867.

## San Francisco:

Saturday Morning, Feb. 9, 1867.

## Notices to Correspondents.

I. Q. M.—We can give no better explanation than the one assigned by chemists for the failure of wood to ignite in a phosphorus flame, viz.: That the surface of the wood is instantly covered by a film of phosphoric acid, which protects it from further combustion.

A COMMUNICATION from "An Occasional Correspondent," on the cement mines about Forest Hill, in Placer county, and one from "O. J.," of Magalia Butte, noticing another locality in this State, where "native lead" is found, have been received, and will appear next week.

ECCENTRIC, San Francisco, says he is learning a machinist's trade, and desires to procure the best works whereby he may enlighten himself with regard to marine and locomotive engines. "Bourne's Catechism of the Steam Engine," is the best work to begin with. It may be had at almost any book store for \$3 or \$4. A large treatise on Engineering, by the same author, price about \$15, would be the best work to take up next.

PAUL PRY.—The antiquity of pre-historic man has been further established by the recent discovery at the hematite mines, in Furness, North Lancashire, England, of a human skull, which "was found at a depth of thirty-three yards, in what is called an 'old man's working.'" The peculiar conformation of the skull has been submitted to several competent authorities, and they all appear to have arrived at the conclusion that it is the skull of an Ancient Briton. An able article appeared in the last number of the North Lonsdale Magazine, written to prove that the Ancient Britons were not only "iron miners," but that they were not the ignorant, painted savages which early writers, especially Caesar, have led us to believe. The employment of scythes as an offensive weapon in the war chariots of Boadicea, would appear to establish the fact that the Britons at that early period had got beyond the Age of Bronze and into the Age of Iron.

TYRO.—Electricity, in its simplest form, has been known for more than 2,000 years. When amber is rubbed upon such bodies as fur, wool or silk, it acquires, for a short time, the property, first, of attracting light objects, such as fragments of paper and particles of bran, and afterwards of repelling them. Until about 250 years ago, amber was the only substance known by which such effects could be produced. Dr. Gilbert about that time, discovered that a number of other bodies, such as glass, sealing-wax and sulphur, might be made to excite similar phenomena. The power thus brought into action has been termed electricity, from *electron* (amber), the substance in which it was first observed. Independently of its being induced by friction, it has been found that electricity is also produced by chemical action, by vital operations, by heat, by magnetism, by compression, in fact by almost every motion that occurs upon the face of the globe. Electricity neither increases nor diminishes the weight of bodies subject to its influences, nor enlarges nor reduces their bulk. It may be excited in all substances, may be communicated from one electrified or excited body to another previously in a neutral or unexcited condition, or it may be stored up for future experiments.

The line in last week's issue, revoking S. D. W.'s commission, was inserted through a misunderstanding.

## The New Mineral (?) "Partzite."

Since the appearance in our issue of January 19th, of the communication of Mr. Arents, describing what he considers a new mineral, found in the Blind Spring mountains of Mono county, in this State, we have met with several persons who have examined this mineral, in place, at Blind Springs, and who have also met with it elsewhere (in Reese River and Arizona). The impression in each case is averse to the idea of its being a new mineral; said opinions being founded on careful analyses thereof.

A specimen from Blind Springs has been placed in our possession, a portion of which we handed to a friend for analysis. It has a green appearance, varying from greenish-yellow, in all grades, to nearly black. Separate analyses of the light and dark portions of the mineral show the following composition:

	Light Green.	Dark Green.
Gravity.....	4.95 to 5.02	5.25 to 5.30
Hardness.....	4.5 to 4.7	4.2
Antimony and Lead.....	41.0	46.5
Copper.....	11.2	14.7
Silver.....	0.3	1.3

With carbonic acid, silica, and sulphur.

The darker the ore, the larger is found the percentage of carbonic acid and sulphur; while silica increases with the lighter color, assuming more luster and becoming harder. The antimony was not parted from the lead; the proportion of the two metals are judged, proximately, at fifteen of lead and twenty-eight of antimony. This analysis, it will be seen, presents a very marked difference from that made by Mr. Arents, especially in the excess of lead and lack of silver. We very much regret that Mr. A. did not furnish us with a sample of the specimen from which he made his analysis. We presume his analysis was correct; as we understand from those who have analyzed the mineral from each of the several localities where it is found, that it is very variable in its composition.

The mineral is a silico-carbonate, and instead of being a new mineral, has probably been metamorphosed, by heat, from a sulphureted ore, with the metamorphism arrested before it had arrived at a completion; hence, the presence of a residue of sulphur, and the very variable amount of all its constituents. The progress of the action of metamorphism appears, commencing from the darkest portions of the mineral, to substitute carbonic acid instead of the sulphur; both of which diminish in quantity by the increase of silica changing color in proportion.

Compared with sulphureted ores, the argentiferous grey copper ore (fahlerz) is nearest in composition, although it is seldom that fahlerz is found containing lead.

The Blind Springs ore, we are told by those who are familiar with it, contains silver, in very variable proportions, from less than one up to thirteen per cent.; the darkest portion of the ore being the richest in that metal. The general average of lead in the ore is much greater than that given in the single analysis of Mr. Arents.

Similar ore, as we have already said, is found in Reese River (Columbia district) and in Arizona. When there is no silica in the mineral, as is the case with the Reese River ore, and some specimens from Arizona, the appearance is dull, without luster. The other constituents agree substantially with the ore from Blind Spring.

Argentiferous lead ore occurs in a similar condition in Arizona, showing a gray, horny, chondroid fracture, from a gray color to nearly black—the district being the richest in silver, and containing also more sulphur and less carbonic acid than the light-gray portions. It assumes a greenish color when copper is present. The connection of this mineral with galeua shows distinctly its transformation into the carbonate.

We are much obliged to our Mono correspondent for introducing this discussion, although we cannot but think him in error. It has brought to our general notice a valuable ore, which, whether it was entitled to

the position of a new mineral or not, is certainly well worthy of careful study and search. We understand that it has already become the object of extensive mining operations at Blind Springs, and we presume it will be found valuable for mining elsewhere. It will be well for miners, and particularly prospectors, to acquaint themselves with its appearance and value. Specimens can be seen at this office. We should be pleased to hear further from our correspondent, particularly with regard to the working and yield of the ore by mill process. Our columns are also open to any rejoinder with regard to the scientific characteristics and claims of the mineral.

## Mining in Australia.

By a very useful requirement of an Australian Act of Parliament, relating to joint stock mining companies in that province, the assets and liabilities of every company must be officially published, if we are not mistaken, as often as once in every six months. In this manner the soundness or otherwise of every company may be readily known by every stockholder (who reads the papers) without the time and trouble required in an examination of the company's books. It also operates as a pretty effectual check against mismanagement in any way.

By the returns of July last, it appears that there are 581 companies, whose aggregate indebtedness is but a little over five millions of dollars; while they have uncalled for capital to the extent of nearly fifteen millions, with an estimated value of machinery and other assets reaching \$30,000,000. These figures are certainly very satisfactory. Some of the companies hold large areas of valuable and productive freehold, entirely apart from their mining plants.

The reported yield of the United Extended Board of Hope Company, for the previous six months, is set down at \$509,270; out of which \$335,000 had been distributed as dividends. This company has taken out three and a half tons of bullion in two years, valued at \$1,807,000; out of which \$1,064,000 has been distributed as dividends. The actual subscribed capital of this company is under \$250,000.

The dividends paid by twenty-four companies during the month of August last amounted to \$219,210. The Australians, now and then have a good streak of luck. It appears that the *Nil Desperandum* cement mine, in Taradalo, was lately sold, with mill and 20-horse power engine, for \$5,000. In two months afterwards, the new proprietors struck a new lead which yielded eight ounces of gold for twenty-eight car-loads of cement. The lead was supposed to be continuous. Deep gravel and cement mines are found in Australia, the same as in California, often overlain with volcanic debris, etc. Mining prospects in Australia are decidedly in an improving way.

New Zealand still continues to keep up and increase the aggregate of its gold yield. The official reports for the year ending June 30th, 1866, gives a yield of 14,298,245; with a grand total, since the first discovery of the mines, of \$55,530,040.

CHANGE OF PROPRIETORS.—We notice that Mr. E. D. Waters, of the *Mercantile Gazette*, of this city, has associated with himself in the proprietorship of that paper J. H. Carmany, of the *Weekly Stock Circular*, and T. F. Cronise, formerly proprietor of that publication. The firm will be known as E. D. Waters & Co. The *Gazette* is one of the oldest newspaper publications on the coast, and is of indispensable value to the mercantile interest of this city.

GOAT VS. SHEEP.—It is said that the Cashmere goat is more easily kept than the sheep, that the yield of wool is much greater, that this wool is worth more than three times as much as any other, and that some parts of our country are well fitted for its raising.

## The Late Mine Explosion in Little York.

It is singular that, with even the terrible English catastrophes before them, the details of which we have scarcely yet finished reading, and by which nearly 600 lives have been lost, miners will still neglect the most ordinary precautions to guard against such accidents as gas explosions in mines. The Nevada Transcript has informed us of an explosion which occurred in Curran &amp; Buckman's mine, in Little York, on the 24th ultimo. It appears that the workmen had opened into some old works a day or two before, when a slight explosion took place. On the 24th three men went into the tunnel, each carrying a candle, (1) one of whom was about 100 feet in advance of his companions, near where, when he had arrived at a certain point, a slight explosion took place, when, in an instant, they were all three enveloped in flames! The Transcript is informed that there appeared to be two currents of gas, and that the flame followed the lower one and returned toward the two men by the upper one. It burned very much like alcohol, and "roared like thunder." The man farthest in was considerably burned about the face and hands, and the others had their hair and beard singed, but neither of the men were seriously injured.

The phenomena of the peculiar action of the flame or explosion may be explained in the following manner: There were, as is generally the case in all tunnels, two currents of air—an upper and a lower one. Whenever any of the lighter or inflammable gases are allowed to reach the atmosphere, they are immediately taken up and carried along by air currents, if any exist. The gas appears to have a disposition to concentrate in the center or strongest portion of the current. In the above case the comparative quiet atmosphere in the center of the tunnel did not contain enough gas to become explosive; but formed a medium through which the fire could not pass from one current to the other. Hence, the flame was confined to a narrow flow of gas, along the center of each current, passing from the candle which lighted it by the lower or heavier current to the end of the tunnel, and back again by the upper or lighter and outward current to the mouth of the same.

A phenomenon similar to the above occurred at the time of the explosion in the Masonic Temple, in this city, about two years ago. The man who witnessed it, stated that the fire appeared to move from his candle, as if a train had been set from the place where he stood in a direct line across the room; it no doubt followed a current of air, into which it had been drawn from the leak, and by which it was being conveyed out of the building through a window opening near the sidewalk.

Gas, when mixed in small quantity, only, with atmospheric air, will burn but slowly, as above described, "like alcohol." When mixed in its proper proportion for burning, it will explode with the suddenness of gunpowder, and with great violence, producing such an amount of carbonic acid gas as to render the atmosphere, if the explosion has occurred in a confined place, impossible for respiration.

Where miners have reason to fear the presence of explosive gas, as in the above case, great caution should be employed in entering a tunnel. Had the ventilation of the tunnel in the above case been such as not to have afforded a very free egress for the gas, it must have accumulated during their two days' absence in such quantities as to have thrown out, by its explosion, all three of the men who entered, as if discharged from a cannon's mouth.

THE EMPIRE MILL AND MINING Co., of Gold Hill, Nevada, has declared a dividend of fifteen dollars per share, payable on the 9th inst. This company has paid two dividends since the first of January last, which aggregate \$30,000.

## Beets and Beet Sugar.

Mr. Carl Spreckles, the projector of the Bay Sugar Refinery in this city, has just returned from Germany, where he has been "taking notes" with reference to the introduction of sugar making from beets. He intends to erect an establishment for the purpose as soon as he is assured of a sufficient constant supply of beets to keep it in operation.

From figures recently noted, giving the amount of cane sugar annually used on this coast, the duty paid upon it, and the price at which it is wholesaled, as also the amount of sugar to be made from an acre of beets, and the extraordinary yield that those roots make in California, we are forced to the conclusion that the crop would be a most profitable one for our farmers here. It is said that nearly 20,000 tons of sugar was brought into San Francisco during the year 1866. The wholesale price was, upon the average, about nine cents per pound. The duty is from three to five cents per pound. Now, an acre of land will yield in France and in some of our Western States where this root has been cultivated, about ten tons of beets, which will make say one thousand pounds of sugar. But it is said that in the Sacramento valley as high as fifty tons to the acre has been raised! Making all allowances, we think one could safely reckon upon a clear profit of one hundred dollars to the acre. The market will not be easily glutted, for this sugar would soon supplant the imported in our market; for it can be sold, with a profit, at a cost scarcely greater than the duty alone which is paid upon the latter.

The enormous size which our California beets attain, is not, it is said, at the expense of saccharine richness, although it might be so supposed. There is one point, however, on which we would like more precise information. This great size is, we are told, reached especially in soils abounding in alkaline constituents. Now, it is stated that in Europe those soils are avoided by beet growers, for the reason that the molasses from the beets raised upon them, although abundant in quantity, will not crystallize, and is, therefore, unfit for sugar. Even if this be true, there is still a large margin in favor of California over European growers, in soil that is suited for the purpose, in the single fact that we have a climate free from moisture in the summer months. A dry atmosphere and warm sun is peculiarly favorable to the retaining of the saccharine matters by the roots.

Machinery for the manufacture of beet sugar is exempted from taxation by Congressional act. Moreover, the California Legislature passed an act in 1862, offering a premium of \$500 for the first one hundred bags of beet sugar, each containing one hundred pounds; adding another \$150 for the same produced the next year, and \$100 for the same produced the third year.

The labor involved in the culture of this crop is light, and the cost of seed trifling. The experiment is, in our opinion, well worth trying. Mr. Spreckles' manufactory will probably be ready by the time the crop is gathered.

**CORNISH ROLLERS FOR CRUSHING QUARTZ.** The great defect in these rollers has been, that they would wear concave in the middle of their surfaces, so that they could no longer be set up to grind to the required fineness. An improvement has been recently made, however, says the *Gas Light Journal*, which effectually does away with this objection. It simply consists in dividing each roller in the middle, making, in fact, two of each. When worn down on the inner edge, these can easily be separated and reversed; the edges which were before the outer are now the inner, and the roller is convex in the center. When worn down as before, they can be again reversed; and thus be made to last indefinitely.

## A Gold Dredging Machine.

At a late meeting of the Polytechnic Association of the American Institute of New York, Mr. Johnson submitted the model of a new dredging machine, about to be employed on the Chattahoochee river, Georgia, for the purpose of raising the sands of that river preparatory to washing them for gold. The machine, consisting simply of a flexible tube, six inches, more or less, in diameter, according to the service expected, is thrown over the side of a boat or vessel. The end of this tube is so connected as to rest with its lower and open face upon the sand to be raised; the other end is connected with a centrifugal pump on board the vessel. He claims that with this he can raise ten tons per minute of any loose sand or sediment. Even stones, to the size of small cobblestones, would pass freely through the pump with the finer and fluid mass.

Another member, Mr. Lee, remarked that he had successfully employed a similar apparatus for removing the sand around sunken wrecks, for widening the channels of rivers, bays, etc. The plan might be used with good success for dredging harbors, docks, etc. He had used it in seventy feet depth of water.

If the above remarks are warranted, we see no reason why such a machine might not take the place of the ordinary dredging machine for harbors, etc. The principle on which it is constructed would seem to admit of a more economical elevation of dock mud than those on which that substance is now brought to the surface.

Moreover, when gold is contained in the loose sands of river-beds, as it often is, and on the sea beach, as at Gold Bluff, it might be worked by hand or horse-power. The expense of such an apparatus need not be heavy.

In answer to some objections, with regard to the utility of such a machine for gold working, suggested by a member, Mr. Johnson, who introduced the model to the attention of the association, remarked that he was sanguine of the success of the enterprise for that work in certain localities, as, for instance, in the Chattahoochee river. He had worked the sands of that river for gold, and found the precious metal in the loose as well as the closely packed or dead sand. Black sand was also found mingled with the former, as well as with the latter, and wherever it was found in that river it yielded fine gold.

**ELEPHANT REMAINS FROM THE NORTH WEST COAST.**—Professor Blake has shown us some very fine specimens of elephants' grinders, presented to him by Col. Bulkley, of the American and Russian Telegraph Survey. One of these grinders is in a very remarkably fine state of preservation, showing the enamel somewhat mineralized, with a portion of the roots attached; the other has evidently been a long time subjected to the action of water, probably on the sea shore, by which it has become much abraded. The former was found at the mouth of the Yukon river; the latter is from St. Paul's Island, near the middle of the Behrings or Kamtschatka sea. The fossil remains of elephants, of a race quite different from any now existing, are very numerous along the northwest coast of America, and other lands near and within the Northern seas. These remains prove that the elephant was once quite numerous in those high latitudes, as well as in the lower latitudes of Southern Europe and Central North America. Such remains are of frequent occurrence in the middle portions of California. One of the most interesting circumstances connected with the specimens before us, is the fact, as stated above, that one of them was found on St. Paul's Island, which must, consequently, have once been connected with the main land, although it is now separated from it by an expanse of water some 300 miles wide. The continents of Asia and America were, doubtless, once united at Behring's Straits, and furnished the pathway by which animals were distributed over this continent from the great center of creation in Southeastern Asia.

**SMALL PORTABLE ENGINES**, for local work, are gradually coming into use for various purposes. The wonder is that our people have not sooner learned their value, and introduced them in greater numbers for more varied purposes. We now employ them, either as an integral part of the engine, or entirely separate, for pile-driving, for loading and unloading ships, for fire engines, for threshing-machines, for pumping, etc. The latest employment of that kind we have noticed, in this city, is that of raising material in house building. We perceive that the hod-carrier and the common laborer find no employment at the large warehouse now in process of erection at the corner of Sansome and Bush streets. The contractors for that work have stationed a small, portable engine inside of the building, which raises all the brick, stone, mortar, timber, and other material, which is usually elevated by slow, tedious and expensive hand labor.

In London, certainly, and possibly in some of the cities on the continent, such engines are very generally employed. So advantageous have they been found in London, that there are parties there who make a business of keeping such engines, of various capacities to suit different kinds of work, to lease to small contractors who cannot make it profitable to own their own machinery of this description. The larger contractors, of course, own their own engines. There is scarcely a brick house put up in the city where such an engine could not be profitably employed. Their use for unloading ships is one of the most important improvements of this fast age. To-day a 3,000 ton ship can be discharged and loaded as soon as a 300 ton schooner could have been handled fifteen years ago, or before the introduction of the donkey engine. Four times the amount of business can be done in a given space of water front, by the use of such appliances, as could be got through with by the old method of hand work, or even the later and still practiced horse power. Give the donkey engine a fair show, and it will reduce the space required for our water front two-thirds. Let water front speculators, who are huying up lots two or three miles south of Rincon Point, think of this and make a note of it.

**CALIFORNIA GRAPE SLIPS FOR THE EAST.** Horace D. Dunn, Esq., California correspondent of the National Agricultural Bureau at Washington, will send to that Department by the steamer of to-day a large variety of California grape slips, to be propagated in the experimental gardens at Washington for cultivation in the Southern States. Among them are fifty slips of the Fifer Zagos, a raisin grape, and twenty-five each of the Black Prince, Verdelho, Muscat of Alexandria, Golden Forest, Red Tramina, and the White Pinneaux. These vines are all from B. N. Bughey's Natoma Vineyard.

A shipment of California potatoes, of the best seed variety, will also go East by the steamer of to-day. These potatoes are shipped for seed, and with the view of improving this esculent in the Atlantic States. A few of these potatoes were sent thither some ten years ago, by way of experiment. The result has been so satisfactory that quite large shipments are now going forward for that purpose. Thus California comes to the rescue in a new field—to improve the worn out vegetables of the Eastern States.

**THE MECHANICS' INSTITUTE** had a full meeting on Thursday evening. The report of the Secretary for January showed a balance in the treasury of \$1,178.25. W. McKibben, P. M. Randall, S. D. Piper, Mr. Hincley, and H. F. Williams, were elected a committee of five to nominate officers for the next term. They will report at the adjourned meeting, two weeks hence. Mr. Patten, the architect of the new Institute building, submitted a communication, explaining his failure to report. Mr. O'Connor gave notice of a resolution to be offered at the next meeting, requiring the nominees to pledge themselves to the adoption of the eight-hour law.

Mr. E. H. Hall, who has been spending some time in this city, and who has visited various other parts of the Pacific coast, collecting material for a forthcoming "Guide Book for the Great West," takes his leave to-day, overland, via Virginia City, Great Salt Lake, etc. The work will be published by the house of D. Appleton & Co., of New York, and, in addition to the usual matter of a guide book, will contain a large amount of valuable statistical matter, a digest of the resources of the various States and Territories which will be comprised within its scope, etc. The whole will be carefully compiled, chiefly from personal observations by Mr. Hall, and will doubtless prove a valuable addition to the published facts with regard to the resources of the Pacific coast and the "Great West" in general.

Hops will be largely raised this season in Los Angeles county.

## City Amusements.

**METROPOLITAN.**—On Monday night the "Sheep's Foot" was performed for the first time by the Martinetti. Miss Emma Howson as Don Guzman, Miss Clella Howson as Leonora, and Willie Edwain as Nigodomo, are extremely good. Little Ignacio makes a beautiful Cupid, and presents himself in the most unexpected places. There is some fine dancing in the first act. The gymnastic performances are also very good. The machinery works smoothly now, and the piece will probably have a long run.

**OFFER HOUSE.**—"Griffith Gaunt" was played till Wednesday. Thursday night "The Lady of Lyons" was performed, with Mrs. Sophie Edwin as Pauline, and Mr. McCullough as Claude. Mrs. Edwin's reappearance was greeted by a full house. Miss Alice Kinsbury commences a second engagement this week, playing "Fanchon." Next week, "The Long Strike."

**PLATT'S HALL.**—The San Francisco Musical Fund Society gave their third annual Concert and Ball on Thursday evening. It was well attended and gave good satisfaction.

**POLYTECHNIC HALL.**—A museum of curiosities, Punch and Judy and a Flying Machine, at 312 Montgomery street.

Mining Engineer of Cornwall,  
WHO CAME TO WORK LEDGES FOR A NEW YORK Company, at Humboldt, Nevada, is free for examination or Superintendence of Mineral Properties, in consequence of his condemnation and immediate abandonment of those operations.  
Reference—B. W. Menon, 528 Clay street, San Francisco, 6v14tf  
Humboldt City, Nevada, 6v14tf

J. M. STOCKMAN,  
Manufacturer of  
**PATTERNS AND MODELS,**  
(Over W. T. Garratt's Brass Foundry.)  
S. E. Corner of Mission and Fremont sts.,  
6v14tf  
SAN FRANCISCO.

**A. S. Hallidie & Co.,**  
MANUFACTURERS OF  
**FLAT & ROUND WIRE ROPE,**  
For Mining, Shipping, Ferry,  
AND GENERAL PURPOSES.

Office—412 Clay street, ..... Works—North Beach, SAN FRANCISCO.

**NOTICE.**—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes. It has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

**Round Wire Rope**—Iron or Steel, for Hoisting.

**Flat Wire Rope**—"

**Soft Steel Wire Rope**—For Derrick Laid Ropes—very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

**Galvanized or Ungalvanized Round Wire Ropes**—for Ships' Rigging, Derrick Gears, Ferry Ropes, and all standing purposes.

**Steel Ferry Ropes**—For wide streams. Ferry Blocks supplied.

**Iron and Copper Wire Cord**— $\frac{1}{2}$  to  $\frac{3}{4}$ -inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.	
Cir. Wt. per 100 ft.	Cir. Wt. per 100 ft.	Cir. Wt. per 100 ft.	Size Link.	Brk'g Str'n.	Wt. per 100 ft.

2 88	2 55	6 130	$\frac{3}{4}$	341	11 3,700
3 170	2 91	8 236	$\frac{3}{4}$	533	19 6,300

Tables containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13-6m9p

**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the *MINING AND SCIENTIFIC PRESS*, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic Hay, Bag screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Plate, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Burrels, Arastra Clearing, Chile Mills, Settlers of all descriptions, Refrorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for Wood or Iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screws, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

**STEAM CARRIAGES ON COMMON ROADS.**—  
We are constantly hearing of the successful  
application of steam carriages to common  
roads, and new enterprises in that direction.  
The latest case of the latter is the contem-  
plated establishment of a line of such car-  
riages on the road between Marsilles and  
Aubergne, France. The distance between  
the two places is ten miles; there will be  
three departures daily, and the price of a  
ticket out and back will be twenty cents.

It may not be generally known that active  
steps are being taken in this city to try the  
experiment of steam carriages on common  
roads, in some of our interior or transmon-  
tane valleys. The late successful results in  
Europe, we trust, will afford such encour-  
agement as to warrant a repetition of the  
experiment on this coast at an early day.

**OIL IN COLUSA.**—The Marysville Appeal  
of February 1st, says the prospects of Mar-  
cuse & Co. are very flattering. "At a depth  
of 373 feet the well discharges daily from  
500 to 600 barrels of water, which has  
changed lately from a salty, bitter taste, to  
a pure soda, sparkling and colorless. This  
well is also so strongly charged with gas as  
to clean itself of all chips, rendering sand  
pumps unnecessary."

**CASTOR BEAN.**—W. P. Weeks, of Mazat-  
lan, says that the castor bean grows wild in  
abundance near that place, and could be  
collected in any amount, if there is a market  
here for it which will make it remunerative.

In 1850 the daily water supply of Lon-  
don was 44,383,000 gallons; in 1856, 80,-  
000,000; and in 1865, 108,000,000 gallons.

**TOWNE & BACON,**  
Book and Job Printers,  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices

In this City,  
**536** Try them  
With a Job,  
And you will be  
Satisfied the above  
Statements are facts.

Their office is at 536  
Clay St., below Montgom'y,  
Over Pacific Fruit Market.

#### CALIFORNIA BRASS FOUNDRY.

STEAM ENGINES OF EVERY DESCRIPTION BUILT  
to order—Marine, Stationary, or Locomotive.

HOISTING AND PUMPING ENGINES,  
PORTABLE ENGINES, OF ALL SIZES,

DONKEY PUMPS, Etc., Etc., Etc.

The attention of the parties engaged in shipping or inland  
navigation is called to the

Superior Workmanship

of Mr. LOCHHEAD, who has been in the business in San  
Francisco for the last fourteen years, and enjoys the repu-  
tation of having built ONE HUNDRED AND SEVENTEEN  
STEAM ENGINES.

Screw Propellers of all kinds, and Steam Boat Machinery  
generally, made to order, and warranted to give perfect  
satisfaction in every particular. 25x12-3m

**THE ENGLISH NAVY.**—The most eminent English engineers are endeavoring to devise some method for the utilization of the English wooden navy. It is generally conceded that, although the wooden vessels of England have been built on the most approved plan for such ships, they are totally unfitted for the new mode of warfare, first introduced to the world during our late intestine conflict. Some advocate the propriety of cutting down the two and three deckers to the lower deck, and fitting up the hull with iron armor. The general opinion seems to be that such vessels would be suitable only for conflicts with such antagonists as the Chinese or Japanese would present; they would not stand, for an instant, against the *butting* of the modern iron *ram*; and no internal improvement can make them fit for such work. The general opinion seems to be that England has got to make up her mind that she must begin anew and build up an iron-clad navy. The expense of such a navy, at all commensurate with the mercantile interests of the country, will be enormous; but no other alternative appears to be left.

While England, owing to the perverseness of her engineers in refusing to accept the principles on which the United States have proved that iron-clads could be made serviceable, has lost nearly all she has already done in this direction; Russia, more ready to acknowledge merit, irrespective of its source, has now an effective iron-clad fleet of at least *thirty* war vessels of all descriptions. Russia, moreover, will not fail to keep the superiority she has already secured. She is now, on the ocean, more than a match for any European Government, and will, in all probability, ever remain so. Russia and America do, and ever should, hold the balance of power against all the rest of the world.

**INDIANS IN NEW MEXICO.**—A monster petition, fifty-two feet in length, containing the names of all the prominent citizens of New Mexico, has been forwarded to Washington, praying for an increase of the military force in that territory, to protect the lives and property of the inhabitants against the Indians.

**To Owners of Copper Mines and Smelting Works.**

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 5v141t

### Remarkable Cure of J. Calwell,

Who had all the symptoms of being in the last stage of consumption, by the use of ALLEN'S LUNG BALSAM.

DEATH, Hamilton County, Ohio, April 6, 1883.—Messrs. DARRIS & Co., Gentls:—As I have reason to believe that Allen's Lung Balsam has been the means of restoring my health, I feel that the afflicted ought to know what it is doing. I was first attacked with a violent cough, attended with cold night sweats. My feet and limbs swelled. The above symptoms continued for months, until I became confined to my bed, and reduced almost to a skeleton. My physicians and friends considered my case as entirely hopeless; that I could not live. At this crisis I commenced to use Allen's Lung Balsam, which was strongly recommended to me for the cure of consumption. To the astonishment of all, I began to recover almost immediately, and in less than three months' time I gained sixty pounds. I owe all to the use of Allen's Lung Balsam. I now enjoy good health. Respectfully yours, JAMES CALWELL. 4v141m

Sold by all Medicine dealers everywhere. 4v141m

### B. F. HOWLAND, PHOTOGRAPHER,

Nos. 25 and 27 Third street, east side, near Market street, San Francisco.

Enamelled Cards, Ambrotypes and Sun Pearls, executed in a superior manner. Small pictures copied and enlarged to any size, at one-half the price usually paid for such work. Cartes de Visites only \$3 per dozen. View-cards at \$4 per dozen. We warrant our work to be superior to any made in this city or State. Give us a call and see our specimens. 5v141m

### Attention! Attention! Attention!

All the new models for sale very low. 12v131r

ALBERT E. CRANE.

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

## NATIONAL Insurance Company!

SHAW, San Francisco, care Mining and Scientific Press. 14v13m

## CONNECTICUT

## Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

## THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Business,  
The Largest Income.

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1883.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—  
Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NO-CASH Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums ONE HALF.

When notes are given for Annual Life and Continued Endowment Policies, no notes will be required after the fourth payment, and the returned surplus—dividend—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

## DIRECTORS:

JAMES GOODWIN, GEORGE S. GILMAN, MARCUS F. BOUGES, N. M. WATERMAN, E. B. WATKINSON, Z. PRESTON, HENRY C. ROBINSON, GUY R. PHELPS, E. D. HIFFANY, CHARLES F. THAYER, JOHN C. PALMER, THOMAS Sisson.

A. D. SMITH & CO.,

General Agents Pacific Coast, Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13-11

## Accidental Insurance!

The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

## ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

## SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tens of the Annual rate, as follows:

1 month, 2-10.	4 months, 5-10.
2 " 3-10.	5 " 6-10.
3 " 4-10.	6 " 7-10.

## GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices throughout the country.

They insure for \$5,000, and \$25 per week compensation, against Accidents of every description, Travelling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance in which the insured may at the time be traveling," but they are GENERAL ACCIDENT TICKETS.

## SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates vary with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. B. Eddy, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

## INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

## METALLURGICAL WORKS,

Practical Mining School,  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.THE Proprietors are at all times prepared to work or test  
Ores sent to this establishment—either in large or small  
quantities—by such process as may be found best adapted to  
their chemical character, after a careful analysis has been  
made. Test lots of Ore adapted to the smelting process at-  
tended to. Sulphuret, pyrites, and the (so-called) "rebel-  
lous ores," are having especial attention paid to their suc-  
cessful treatment. Assaying in the hand and dry way.  
Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications  
from gentlemen desirous of pursuing the study of practical  
metallurgy—have concluded to admit parties on reasonable  
terms. Having in their Mill all the necessary appli-  
ances for crushing, roasting, amalgamating, smelting, re-  
fining and assaying, as also a well extended Laboratory for  
the analysis of Ores and Minerals, a good opportunity is  
here offered to acquire a sound practical knowledge of the  
business.

Subscribe Now!Important to Californians.—Many inventors have  
lately had their claims for Patents seriously (and in some  
cases fatally) delayed by the unqualification of agents who  
have not complied with the Government license and revenue  
laws, as well as other new and imperative regulations.  
These discrepancies, although arising from the inexperience  
of honest agents, are none the less dangerous to applicants  
for patents, whose safest course is to trust their business  
with none but active and experienced solicitors. THE MIN-  
ING AND SCIENTIFIC PRESS PATENT AGENCY has strictly com-  
plied with the requirements of the Department, and properly  
died all necessary papers as Claim Agents.Postage.—The postage on the MINING AND SCIENTIFIC  
Press to any portion of the United States is twenty cents per  
annum, or five cents per quarter, payable in advance at the  
Post Office delivering the paper. Postage free in the city  
and county. Foreign postage (with few exceptions) two  
cents per copy, prepaid. To Bremen and the German  
States (marked via Bremen and Hamburg line), three cents  
per copy, prepaid. Single copies to any address in the United  
States, two cents.Engraved to Order.—Persons who desire to illustrate  
their individual establishments or business, should give us  
their orders for Engraving and Printing, and we will guar-  
antee good work and reasonable prices.

## OLIVER ELDRIDGE, Agent.

COPPER IN THE COAST RANGE.—The edi-  
tor of the Nevada Gazette recently saw some  
very rich specimens of ore from the mine  
of the Lyon Copper Mining Company, near  
the town of Ashton, in the Coast Range.  
Seven hundred pounds of this ore, it is said,  
was lately smelted at the company's works,  
and yielded five hundred pounds of pure  
copper.

## New Mining Advertisements.

**Blue Ledge Gold and Silver Quartz Mining Company,** Kelsey District, El Dorado County, California. Office, No. 5 Government House, corner of Washington and Sansome streets, San Francisco.

Notice is hereby, that a meeting of the stockholders of the above named Company, will be held on the twenty-third day of February, 1887, at 10 o'clock P. M. of that day, for the purpose of altering the By-Laws of the Company, and transacting such other business as may come before said meeting.

J. M. BUFFINGTON, Secretary.  
San Francisco, February 4, 1887. feb9

**Diamond Copper Mining Company,** Location: Bockland District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1887, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 33 Montgomery Block, San Francisco, or to R. B. RANDALL, the Company's Superintendent, at Crescent City, Del Norte County, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room No. 33 Montgomery Block, corner of Montgomery and Washington streets, San Francisco, Cal. feb9

**George Washington Gold and Silver Mining Company,** Location of Works: Silver Mountain District, Alpine County, Cal.

Assessment No. 17.  
Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of February, 1887, an assessment of three dollars and fifty cents (\$3.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the Company, only.

Any stock upon which said assessment shall remain unpaid on the ninth (9th) day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.  
Office, 333 Montgomery street, San Francisco. feb9

**Ratcliffe Gold and Silver Mining Company,** Brown's Valley, Yuba County, California.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the fifth day of January, 1887, the several amounts set opposite the names of the respective shareholders as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Arcey, Walter W.	463	25	\$25 00
Brogan, P. J.	466	25	25 00
Kleinhaus, T. F.	568	20	20 00

And in accordance with law, and an order of the Board of Trustees, made on the third day of January, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, on the twenty-sixth day of February, 1887, at the hour of 12 o'clock M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

D. F. VEBDENAL, Secretary.  
Office, Room No. 22 Court Block, 635 Clay street (up-stairs), San Francisco California. feb9

## Mining Notices--Continued.

**Arizona Consolidated Mining Company,** Eureka District, Arizona Territory.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1887, an assessment of fifty (50) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the office of the Company, No. 611 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. W. BUNNELL, Secretary.  
Office, No. 611 Clay street, San Francisco. feb9

**Delays are Dangerous.**—Inventors on the Pacific Coast should bear in mind that by patronizing our Patent Agency they can sign all necessary papers for securing patents almost immediately, thereby avoiding the three months delay requisite in transacting business through Eastern agencies.

**Big Blue Lead Gold and Silver Mining Company,** Cove District, Kern County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the third day of January, 1887, an assessment of ten dollars (\$10) per share was levied upon the capital stock of said Company, payable January twenty-sixth, 1887, in United States gold and silver coin, to the Secretary, M. G. ELMORE, at his office, No. 302 Montgomery street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the eighteenth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twentieth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

M. G. ELMORE, Secretary.  
Office, 302 Montgomery street, San Francisco. feb9

**Cherokee Flat Blue Gravel Mining Company,** Cherokee Flat, near Oreville, Butte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of January, 1887, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the Company's office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighteenth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. DE RENALHAG, Secretary.  
Office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, Cal. feb9

**Chilpaneca Mining Company—District of Ceres,** Sonora, Mexico.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of January, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the Company's office, California street, (up stairs) San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the eighth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOISE, Secretary.  
Office, 318 California street, San Francisco, Cal. feb9

**Cosima Silver Mining Company, Cosima District,** State of Sonora, Mexico.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the seventeenth day of December, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Arcey, Walter W.	463	25	\$25 00
Brogan, P. J.	466	25	25 00
Kleinhaus, T. F.	568	20	20 00
Laidley, James	569	60	60 00
Laidley, James	564	133	133 00
Murdoch, A. H.	663	25	25 00
O'Brien, Thomas	663	25	25 00
Bice, J. M.	488	25	25 00
Thompson, I. D.	555	25	25 00

And in accordance with law, and an order of the Board of Trustees, made on the seventeenth day of December, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the auction rooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, Cal., on Monday, the eleventh day of February, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

CHAS. BAUM, Secretary.  
Office, No. 510 Battery street, opposite the Custom House, San Francisco, Cal. feb9

**Evoca Consolidated Copper Mining Company,** Location of Works: Court Hill District, near Black's Ferry, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of January, 1887, an assessment of twenty-five cents (25) per share was levied upon the assessable capital stock of said Company, payable on the eleventh day of February, 1887, in United States gold and silver coin, to the Secretary, E. THAYER, at the office of the Company, at No. 532 Merchant street, Room No. 3, in the City and County of San Francisco, State of California.

Any stock upon which said assessment shall remain unpaid on Wednesday, the twentieth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the thirteenth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. S. CLYDE, Secretary.  
Office of Company, No. 532 Merchant street, Room No. 3, San Francisco, California. feb9

**Hope Gravel Mining Company,** Location of Works and Property: Grass Valley, Nevada County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the sixteenth day of January, 1887, an assessment (No. 12) of one dollar (\$1) per share was levied upon the capital stock of said Company, payable on the seventeenth day of January, 1887, in gold coin of the United States, to DAVID WILDER, Secretary, at the office of the Company, No. 529 Clay street, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the twenty-third day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eleventh day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

DAVID WILDER, Secretary.  
Office, No. 529 Clay street, San Francisco, Cal. feb9

**Julia Gold and Silver Mining Company, Storey** County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the tenth day of January, 1887, an assessment of one dollar (\$1) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, 607 Washington street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the sixteenth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. NOEL, Secretary.  
Office, 607 Washington street, San Francisco, Cal. feb9

**Postponements and Alterations.**—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

**Illegal Supplemental Advertising.**—It would be well for Mining Companies, whose advertisements are repeatedly appearing in the Supplements of daily papers, to inquire into the legality of that class of advertising.

**Keystone Mining Company, Location of Works:** Copperopolis, Calaveras County, California.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the twenty-first day of November, 1886, the several amounts set opposite the names of the respective shareholders as follows:

And in accordance with law, and an order of the Board of Trustees, made on the twenty-first day of November, 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, by J. Middleton & Son, 404 Montgomery street, San Francisco, Cal., on Monday, the eleventh day of February, 1887, at the hour of 1 o'clock, P. M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

O. P. SUTTON, Secretary.  
Office, 440 California street, San Francisco. feb9

**Lady Bell Copper Mining Company, Low** District Mining District, Del Norte County, California.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of January, 1887, an assessment of ten (10) cents per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, or to J. K. Johnson, President City.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the fourth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

C. HEYWOOD, Secretary.  
Office, 311 Market street, San Francisco, Cal. feb9

**Postponement.**—The day for deeming stock delinquent on the above assessment is hereby postponed until Thursday, the sixth day of February, 1887, and the sale thereof until Monday, the 13th day of March, 1887. By order of the Board of Trustees.

C. HEYWOOD, Secretary.

**Noupparel Gold Mining Company, Location of** Works: Tuolumne County, California.

Notice—There are delinquent upon the following described stock, on account of assessment levied on the twenty-sixth day of December, 1886, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Trustees, made on the twenty-sixth day of December 1886, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesroom of Cobb & Sinton, No. 407 California street, San Francisco, California, on the eighteenth day of February, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

S. A. ELDRIDGE, Secretary.  
Office, 423 Washington street, (Room No. 9) San Francisco, California. feb9

**North San Francisco Homestead and Railroad** Association, at the City and County of San Francisco, Cal.

Notice is hereby given, that at a regular monthly meeting of the Board of Trustees of said Company, held on the eleventh day of January, 1887, an assessment of twelve dollars and fifty cents (\$12.50) per share was levied upon the capital stock of said Company, payable January twelfth, 1887, in United States gold coin, to the Secretary, at the office of the Association, No. 418 California street, Room No. 5, third floor, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twelfth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Friday, the fifteenth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

GEO. W. KINNEY, Secretary.  
Office, No. 418 California street, Room No. 5, third floor. feb9

**American and Foreign Patents.**—Letters Patent for Inventors can be secured in the United States and foreign countries through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We offer applicants reasonable terms, and they can rest assured of a strict compliance with our obligations, and a faithful performance of all contracts. For reference, we will furnish the names of numerous parties for whom we have obtained patents during the past two years.

## NOTICE.

The following resolution was passed at the meeting of the Board of Trustees of the Ophir Silver Mining Company, held this day:

Resolved, That the resolution of this Board, passed at the meeting held December twenty-fourth, 1886, providing for the levying of an assessment of five dollars per share on the capital stock of this Company, on account of informality, be and the same hereby be rescinded.

ROBERT GEORGE, Secretary.  
Office Ophir Silver Mining Company, San Francisco, January 10th, 1887.

**Assessment Notice.**

**Ophir Silver Mining Company—Location of** Works, Virginia District, Storey County, Nevada.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on this tenth (10th) day of January, 1887, an assessment of five (\$5) dollars per share was levied upon each and every share of the capital stock of this Company, payable in United States gold coin, on the fourteenth instant, to the Secretary of this Company, at the office of the Company, Nos. 4 and 5 Court Block, corner of Montgomery and Jackson streets, San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the fourteenth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold at public auction on the first day of March, 1887, to pay the delinquent assessment, together with the costs of advertising and expenses of sale. By order of the Board of Trustees.

Office Ophir Silver Mining Company, Nos. 4 and 5 Court Block, corner of Montgomery and Jackson streets, San Francisco, California.

ROBERT GEORGE, Secretary.  
January 10th, 1887. feb9

**San Marcel Silver Mining Company, Location of** Works: San Marcel, District of Hermosillo, State of Sonora, Mexico.

Notice is hereby given that at a meeting of the

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation.

## V. CUSHING, Agent

— FOR THE —

## Purchase & Shipping of Machinery OF ALL KINDS.

Especial attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to—

Governor F. F. Low; C. T. Meader, Stockton; Jacob Underhill & Co., San Francisco; J. W. Stowe, Russell & Erwin Manufacturing Company; Office, No. 120 Front street, San Francisco.

## HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphureted ores will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor, 22+13-3m San Francisco.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and into the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the PACIFIC FOUNDRY, 1v1 San Francisco.

## Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.** The attention of all interested in mining is respectfully called to this Improved Machine for Crushing, Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price, \$3000

No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour—price, \$500

No. 3.—Or 20-inch Crusher, will in a similar manner crush from seven to eight tons per hour—price, \$1200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

RAWHIDE RANCH, Tuolumne Co., Sept. 28, 1866. JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly, R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$10 per Barrel.

A diagram, with explanations of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California, and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE & RADCLIFFE, Express Building, 402 Montgomery street, San Francisco.

## PATENT HYDRAULIC HOSE SEWING By S. HOWARD,

No. 326 DAVIS STREET, San Francisco.

22+13-3m

## STRONG & CO'S CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Millers, Rolling Shores and reverse action.

Millmen and others are respectfully invited to examine this Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation, daily, at the San Francisco Foundry, Fremont street, near East.

Ores, in lots not exceeding 2,000 pounds, tested by 2v13 O. W. STRONG, Assayer.

## LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED IN the United States or the world, have been fully tested on this coast, more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc.

CALIFORNIA REPRESENTATIVES: E. Stockton, Folsom; O. Simmons, Oakland; Mill at Clear Lake; Morgan Coville, Lexington; Santa Clara County; J. Y. McMillan, Lexington; Santa Clara County.

Send for Circular, to KNAPP & GRANT, Agents for California.

26v13-1yq 310 Washington street, San Francisco

## Hunt's California Pump

HAS all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years. Good judges have examined and pronounced them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 23 Second Street and 110 Jessie Street.

Also, Tread Horse Power, Pumping Frames for Irrigating, Saw Frames, Sweep Horse Power, and Frames, all in one frame, the horse to travel around the frame.

PRICES OF HUNT'S CALIFORNIA PUMPS.

No. 3.—3-inch cylinder, 6-inch stroke—\$30 00  
No. 4.—3½-inch cylinder, 6-inch stroke—35 00  
No. 5.—4-inch cylinder, 6-inch stroke—45 00  
No. 6.—5-inch cylinder, 8-inch stroke—60 00  
No. 7.—6-inch cylinder, 12-inch stroke—80 00

A liberal discount made to the Trade. For further particulars, send for Circular.

E. O. HUNT, 21v13t 28 Second and 110 Jessie streets, San Francisco.

## BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

## The Mechanics' Institute.

Patented December, 1866.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace also feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALENBERG, 19v12 416 Market street, San Francisco.

J. MARSHALL W. WYLLIE.

## GLASGOW IRON AND METAL IMPORTING CO.,

No. 27 Fremont street,

SAN FRANCISCO.

Beg to inform purchasers that they have just received a large stock of Glasgow and Staffordshire best refined Bar Iron, Boiler Plate, Anvils, Cast Steel, Boiler Tubes, Gas and Water Pipes, GAS FIXTURES, etc. They offer the same for cash, on liberal terms, at wholesale and retail. The Company have superior facilities for supplying the constant demands of the market.

Country Orders punctually attended to. 19v13-q

## To Quartz Miners and Others.

NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject examine it. Patent applied for. 1v143m JAMES HITCHENS.

## Gould & Curry S. M. Co.—1866.

This being a representative of the Nevada silver mines, we select certain of the estimates recorded in its report, which we know will be of interest to all engaged in vein mining.

The amount of ore extracted during the year was, in round numbers, sixty-two thousand five hundred tons. Of this, about forty thousand tons was worked at the company's own mill, and the balance at custom mills in the vicinity. All of this was what is denominated "third class ore." The value, reckoning premium and discount on bars, and including amount received for ore sold, was \$1,676,505.38. The expenses of mining, milling, assaying, reducing, etc., amounted to \$1,343,183.74. Dividends to the amount of \$252,000 were declared. The average cost per ton of ore crushed, was \$12.26; of ore amalgamated, \$13.77—the difference being loss in slimes now contained in the reservoirs, to the amount of 3,500 tons, and which, worked, would yield, according to estimate—\$12.50 per ton—some \$44,000.

About \$340,000 was paid for mine labor, and \$163,000 for materials; of which latter, \$11,000 was for candles. For mill labor and hauling, nearly \$200,000, and for materials (freight included) more than \$360,000, of which \$208,000 was for the single item of fuel, \$41,000 for quicksilver, \$18,000 for sulphate of copper, and nearly \$9,000 for salt.

The average yield per ton of all ores reduced, was \$28.47. That which was reduced at the company's own mill yielded \$29, while that reduced at custom mills yielded only some \$26, on the average.

At the mine, the cost of the ore, per ton, is estimated at \$7.86. Of this amount, it is reckoned that \$3.10 was paid for extracting; \$2.11 for prospecting and dead work; \$1.82 for accessory work; 62 cents for improvements; and 21 cents on account of salaries of officials.

The average assay per ton was \$43.95; the average yield, \$33.02.

The amount above given as paid in dividends, is equal to 10½ per cent. on the capital stock.

The total amount of taxes paid by the company was \$33,000, of which \$10,000 was the United States tax on bullion.

The company have leased the boarding house formerly kept under their direction, and sold the stores on hand.

We give the following extract from the Report of the Superintendent:

"By means of 'blanket washings' we have saved, from concentrated tailings and in quicksilver regained, upwards of \$15,000. This mode of concentrating pan tailings is very imperfect; but owing to the situation of the mill, no better one could be adopted. This difficulty is now overcome by the erection of a small mill near the lower reservoir, which will furnish the power to drive any concentrating machines, and which is favorably situated to receive the tailings from the pans of the large mill. The object of erecting this so-called 'Reservoir Mill,' was to experiment upon the pan tailings, and to ascertain how to save a portion of the silver and gold that is lost in our present method of reduction. This loss amounts 25 or 30 per cent. of the assay value of the ore, and for each ton of ore worked, there is a loss of at least one pound of quicksilver, more or less charged with amalgam. Experiments have proven that a saving can be effected. The reservoir mill consists of fourteen flat-bottomed pans, with gearing, bought at a price scarcely exceeding that of old iron, and of an engine, boiler and shed previously in the possession of the company. As the tailings are finely crushed, no stamps were required. It is proposed to cover the cost of building this mill by 'custom work' on concentrated tailings gathered by various parties along the six-mile cañon. Part of the mill, however, will be constantly at work upon our own pan tailings, of which a large amount has been caught in a reservoir."

The Superintendent further says that a saving of \$3,000 per month will be effected in the diminished quantity of wood which will henceforward be used, now that the imperfect valves of the engine have been replaced by new ones.

The farmers in the Russian River region, in Sonoma county, are planting hemp. A remarkably fine article is said to be produced there. Two hundred dollars per ton is offered for an unlimited quantity of such quality. Great interest is felt among certain classes in the Atlantic States, at the recent discovery, in the Humboldt Valley, of a new textile resembling hemp; but which, it is said, is not a genuine hemp, although it has a stronger and finer fiber, and a longer staple; the stalk yields more, and can be stripped and prepared without previous manipulation. If this is true, says an Eastern paper, the plant is an acquisition equal in value to the cotton plant.

**CUSTOM MILLS IN EL DORADO.**—We clip the following from an editorial in the Placerville Courier of January 26th:

What the quartz interest now needs more than any other one thing, is a few custom mills, located at the more prominent mining centers of the county, of sufficient capacity, furnished with all the most approved appliances for saving gold from various qualities of rock, and under the management of capable men, in whose honesty the miner can place confidence.

**SINGULAR EXPLOSION.**—Samuel Cox, of Minnesota, undertook to slack some lime in a kerosene barrel in his cellar. After adding water, he commenced stirring it with a stick. Happening to bring a lighted candle in contact with the gas arising from it, an explosion took place, which threw him to a distance of ten feet, tore a hole four by eight feet through the floor, and was heard a quarter of a mile off.

**COTTON.**—The cotton crop of Egypt, for the past year, is said to have been valued at one hundred millions of dollars.

**MELLVILLE C. KEITH, M. D.**  
Homeopathic Physician,  
No. 655 Howard Street, between Second and Third,

## Gaston's Screw Grinder and Amalgamator

—IS—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect settler. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw muller, and its shoes. The letters show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the muller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the muller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above it, presses all under the muller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

## Rheumatism!!

Still Another Witness!

LATROBE, Cal., Sept. 19, 1865.  
(White Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence of it, are too numerous to mention. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.  
About two years ago I was induced, by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably put it to flight. I therefore cordially recommend it to the afflicted as an unfailing remedy for Rheumatism.  
FRED'K FABER.

**RICHARD'S REMEDY** is for sale by  
**H. BOWMAN, Druggist, Sacramento.**  
And by Druggists generally.

**SAMUEL HILL,**  
General Agent, 111 Montgomery street, San Francisco.  
17v13

**BLASTING BY ELECTRICITY.**—The cost of a battery and 150 feet (double length) of insulated wire for submarine or other blasting by electricity, will cost from \$80 to \$125, together with all the necessary instructions for properly operating the same. The cost of acids for keeping up the same will depend upon the number of blasts which it is desired to discharge per day or week. It will be but a trifle at most. Such a battery will be good for six months of pretty constant use, after which \$40 to \$50 outlay will render it as good as new for another six months. We propose commencing with our next issue to give a general resume of such operations, with a description of the different kinds of batteries which may be employed, the *modus operandi*, the comparative advantage of such a mode of blasting, etc.

### What Others Say of Our Paper.

The *Mining and Scientific Press* comes to us, No. 1 Vol. XIV, in a new dress of clear, open type, manufactured by Paulkner & Son, San Francisco, the first font of type ever cast on this coast. No miner in California or Nevada should be without the *Press*, and we venture the statement, no one interested can invest \$5 more profitably than in subscribing for it.—*Alpine Miner*.

The *Mining and Scientific Press* is all that its publishers claim for it, being a compendium of mining news on the Pacific Coast, and a general disseminator of all matters of interest to the mechanical and agricultural portions of the State.—*Dutch Flat Enquirer*.

It enters the new year in "homespun." To the miners, and all interested in the mines of the Pacific Coast, the *Press* is the most valuable paper published.—*Amador Ledger*.

"The appearance of the paper is first rate."—*North California*.

The *Mining and Scientific Press* presents an appearance that should recommend it to every thinking and reading miner. Its new dress sets handsomely, the print is clear, and its general appearance betokens thrift.—*Esmeralda Union*.

The *Mining and Scientific Press*—a most useful exchange.—*Owyhee Avalanche*.

That excellent paper has donned a new dress of California manufacture.—*Reese River Reveille*.

It was very appropriate that the only socially mining and mechanical paper of the coast should have the first of type from the home foundry.—*Reese River Reveille*.

We rejoice to see our neighbor of the *Mining and Scientific Press* coming out in a new dress—as bright as new type can make it.—*S. F. Evening*.

It deserves a hearty support from the mining and scientific public, and we are glad to see tokens that it is more and more appreciated.—*The Evening*.

"Congratulating you on the many very great improvements you have made upon the *Press*—its usefulness and prosperity."—*Letter from Editor Sac. Bee*.

The *Mining and Scientific Press* commenced a new volume January 5, on new type of California make—the first of the style, the editors say, which has yet appeared in print on this coast. It looks well.—*Humboldt Register*.

### Subscribe at Once!

Such a journal has been needed on the Pacific Coast. The *Press* fills the bill.—*Reese River Reveille*.

## Excelsior Double-Acting Suction and Force Pump.

The Best for Mining, Farming and Domestic Use.

Hooper's Patent, Aug. 15, 1865.

THE EXCELSIOR PUMP is a California invention of intrinsic merit, and as such is being rapidly introduced, and giving perfect satisfaction. At the Mechanics' Institute Fair (1865), it was awarded, for its superiority, a **Premium Medal**.

It is manufactured by California Mechanics, in the most perfect and durable manner.

It is remarkably simple in construction, and its valve chest is almost instantly accessible, without disconnecting the air-chamber, suction or discharge-pipes. It can be worked at any speed.

Figure 1 is a sectional view of a 6-inch Mining Pump, showing the plunger and hemp-packing, and the valve-chest containing the puppet valves. Fig. 2 illustrates the water-passages and valve seats in the chest.

The following sizes are constantly manufactured of this

### SUPERIOR DEEP-WELL PUMP.

No. 1.—Cylinder 2½ inches; stroke, 6 inches; capacity 750 gallons per hour; weight, 60 pounds.

No. 2.—Cylinder, 3 inches; stroke, 7 inches; capacity 1,200 gallons per hour; weight, 80 pounds.

No. 3.—Cylinder, 4 inches; stroke, 9 and 8 inches; capacity, 2,500 gallons per hour; weight, 200 pounds; with iron frame and slide complete.

No. 4.—Cylinder, 5 inches; stroke, 15 inches; capacity 5,420 gallons per hour; weight 500 pounds.

No. 5.—Cylinder, 6 inches; stroke, 24 inches; capacity 12,575 gallons per hour; weight, 1,000 pounds.

Nos. 3, 4 and 5 are made to endure the severe test of use in mines, and are constantly superseding those of other manufacturers. The pistons being packed with hemp, are proved to be far more durable and less expensive than leather.

We manufacture to order 8 and 10-inch Pumps. Also, sell at cheap rates, 5 and 6-inch Brass Pumps for ships.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or

## RUGGLES' PRINTING PRESS.

### For Sale or Exchange.

The Proprietors of the *Mining and Scientific Press* have on hand a Half Medium Ruggles' Engine Job Press, in condition good as new, which will be sold cheap, or exchanged for a good Hand-Press of medium or large size.

**DEWEY & CO., Job Printers,**  
Office, 505 Clay street.

## Our Patent Agency.

THE PATENT AGENCY OF THE *Mining and Scientific Press* has been signalized with remarkable success during the past two years. The importance to the inventive genius of this coast of a thorough and reliable agency for the solicitation of LETTERS PATENT from the United States and foreign Governments cannot be over-rated, and the Proprietors of the *Press*, feeling the responsibility which rests upon them, and the reward which must follow the faithful performance of their trusts, will take care to afford inventors every advantage to be secured to them through a competent and responsible agency upon this coast.

By EXPRESS.—Two cents per copy will be added to our usual rates of subscription (to pay Wells, Fargo & Co's tariff) on papers sent by express. If connecting expresses in the interior make additional charges, subscribers must themselves settle the same.

ESTABLISHED [MAY, 1860.]

## VOLUME FOURTEEN

—OF THE—

## Mining and Scientific Press,

COMMENCING JANUARY, 1867.

**DEWEY & CO., Publishers.**

Issued every SATURDAY, at our Book and Job Printing Office, 505 Clay street, corner of Sansome, SAN FRANCISCO.

## Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

135.—J. McKean, Camptonville, has forwarded to us a mineral stated to have been procured from the neighborhood of copper vein croppings in the Sierra county line. This mineral is of a somewhat complex character. We suspect, from its appearance, that it has been derived from a quartzose granitic rock, probably of the sienitic class, in which the hornblende originally assumed the form of actinolite; but has subsequently been metamorphosed, probably by thermo-aqueous action into the fibrous crystals of tremolite, which is now seen disseminated amongst the quartz matter which surrounds it.

136.—Charles Barker, of Georgetown, El Dorado county, sends us, through the hands of Mr. E. L. Smith, of this city, several very fine octahedral crystals of magnetic iron ore. The crystals are very perfect and highly magnetic.

COMMISSIONERS TO THE PARIS EXPOSITION.—The United States sends ten paid Commissioners to the Universal Exposition at Paris, and twenty honorary Commissioners, without pay. In addition to these, nearly every State sends one or more Commissioners to represent State interests, etc. England, Austria, Russia and Prussia, *per contra*, send only two or three Commissioners each; but it is presumable that, wherever these countries fall behind America in personal display, it will be more than made up in the larger number of articles which they will have on exhibition.

ANOTHER CALIFORNIA INVENTION FOR THE WORLD'S FAIR.—W. P. Miller is now having manufactured, in Philadelphia, a fine set of his adjustable tooth circular saws. R. Hoe & Co., New York, have also engaged to manufacture these saws. They are evidently well thought of in the East:

EN ROUTE TO ARIZONA.—Mr. C. A. Luke, Superintendent of the Specie Basis Company, Sacramento District, Arizona, returned from Philadelphia by last steamer. He will go direct to the company's works, where he is to commence smelting operations.

## The Diamond—Its Production.

The following remarks respecting the natural origin and the probability of an artificial formation of the diamond, being an extract from a lecture recently delivered by the celebrated metallurgist, John Percy, will be read with considerable interest, in connection with the series of articles which we have been publishing on graphite and its synonyms, especially the number in our last week's issue. Before introducing the Doctor's remarks, we would premise by saying that this precious gem is generally associated with a quartzose rock, called itacolumnite, from Itacolumni, a mountain in Brazil, where it occurs. It is a kind of sandstone, which often contains tale, chlorite and mica. A thin strip of it will sometimes bend without breaking, and is known by the common name of flexible sandstone. Diamonds have been found in Brazil, India, Borneo, Russia, and occasionally in North Carolina, Georgia and Virginia; also in California. With regard to their formation, Dr. Percy recently said:

The question is, if this itacolumnite be, as there is no doubt it is, a rock of sedimentary origin, have the diamonds been developed in the rock, by some means or other, subsequent to its formation, or were they deposited there contemporaneously with it? That is the point, and so far as he knew, it is a point which has not been clearly made out at present. All attempts concerning the artificial production of the diamond have hitherto proved most singularly abortive, and we have not the slightest clue in the world to the mode in which the diamond has been made in nature. It is evident that the condition or conditions of its formation must be excessively rare, because the quantity of diamond is, comparatively speaking, so small.

He could not help thinking—and it is the opinion of those who have directed attention to this subject—that one day or other we shall be able to crystallize carbon; but it does not follow that we should be able to crystallize diamonds of any value. It may be that the crystallization of diamonds of large size is a work of time—such work as only nature can accomplish in a satisfactory way. No doubt fluorine, or some similar cement, has played a part in the production of the diamond. It is a suggestion worthy of attention. Compounds of that element are very imperfectly known at present. In chemical works, at different times, processes are described whereby carbon has been separated from combination, and obtained in a crystallized form; but all these statements, he believed, were entirely erroneous.

Liebig has a notion that diamonds are the result of the final natural decay of vegetable matter, but in nature we do not find diamonds under these conditions when we observe the final products of natural decay—in our coal fields, for example, anthracite is one of the finest results of this decay; and no one, he believed, had ever found diamond in a coal-field, where one ought to find it, if it is the result of a final decay. We find graphite in nature, which is a crystalline form of carbon, just where we should expect to find it, but we do not find the diamond there.

But a small portion of the diamonds sold and worn are genuine. The diamond mines of Goleonda have given out, and those of India are rapidly failing. The scarcity of real gems has been met by the ingenuity of counterfeiters, who manufacture spurious

gems that frequently deceive expert connoisseurs. Large quantities of false gems are made in Birmingham and Paris, and shipped East, where the Orientals sell them to credulous European travelers as the real article. Nine-tenths of the diamonds now flaunted are mere paste ornaments, for which their wearers have given large sums.

NATIVE LEAD IN BUTTE COUNTY.—Mr. O. Jennings writes us from Magalia, Butte county, as follows: "In your issue of Jan. 12th, you stated that you were not aware that 'native lead' had been found associated with gold anywhere on the Pacific coast. Mr. Willson informs me that it has been found in a placer mine bearing his name, situated near this town. It was found about ten years since. One piece was about three-fourths of an inch square and one inch long; another was of an irregular form, but heavier than the first named. Others, but smaller pieces, were frequently found. They were all melted up and run into bullets. It melted at a very low heat, as he thought. The bedrock where he was working, was serpentine with a hill of slate to the west, from 50 to 100 feet high; and higher up the hill, is a quartz lode twenty feet wide, containing a considerable quantity or per cent. of cubical sulphurets of iron, but not a trace of galena or lead in any form can be seen at present. The sulphurets carry no gold so far as prospected; neither does the quartz; but still the vein has yielded largely of gold in former times." We now have reports of native lead in two localities on the Pacific coast—in the one above mentioned, and in the Comstock ledge at Nevada, as noticed in our issue of the 26th ult.

Our correspondent further adds, by way of a note, that "log or pole sluices are in use in this neighborhood, and if your readers would be benefited by a description of them, I will send it to you for their benefit." We should be pleased to receive a description of these sluices.

CALIFORNIA WINES IN NEW YORK.—A telegraphic order was received in this city, a short time since, for the shipment of a large quantity of a certain wine, manufactured in this State, if it could be shipped *via* the Isthmus, within a certain margin for freight. The price named was inside of the usual freight charges; but the knowledge that the P. M. S. Company had made an important discrimination in favor of flour, so as to leave a margin of profit to the holder, in the shipment of that article, held out the hope that they might do something, in the same way, to encourage the shipment and production of wine. The Steamship Company could not see it for their interest to do so, and the wine consequently remains in store. It is to be hoped, however, that the Company's design of putting on a *slow line*, for freight, may soon be carried out, when, perhaps, the case in point may be met. In the meantime, we understand that Wells, Fargo & Co., have the matter under consideration, and will ship the wine, if barely the smallest possible margin is left to secure them from actual loss.

THE FOREST TREES OF AUSTRALIA.—A correspondent of the *Morning Call*, of the 8th inst., corrects an error into which we were led in our issue of the 2d inst. in regard to the forest trees of Australia. The article in question was compiled from the recent proceedings of the American Institute at New York. On referring to it again, we find the statement that the blue gum (a species of the *Eucalypti*) "is extensively used in Victoria for engineering purposes, and the stringy bark is chiefly employed for fencing. With the exception of the red gum, these trees cannot be economically used in the construction of piers and wharves, owing to the rapidity with which they succumb to the attacks of marine animals, the Teredo and the Chelura. The Swan River Mahogany, a species of *Eucalyptus*, is the only wood yet used there which entirely resists these agencies." In the haste of reading, we inferred that the "stringy bark" was the bark of the blue gum, instead of being the designation of a particular species of the *Eucalypti*, distinct from the blue gum. Our thanks are due to the *Call's* correspondent for calling attention to the error, which, however, would have been more properly corrected through the same columns which promulgated the error.

CALIFORNIA LEATHER.—Californians interested in the manufacture of leather, will be rejoiced to hear that the new Revenue Bill strikes out, altogether, the tax on the manufacture of leather. The superiority of California leather is fast becoming a generally acknowledged fact at the East, and the shipments thither, especially of solo leather, have been gradually gaining for the past eighteen months, notwithstanding the great drawback in the shape of heavy taxes on the manufacture, which has cut the profits down to near living expenses. But with this tax removed we may expect to see a rapid increase of the business; especially when it is borne in mind that some of the heaviest establishments have been able to sustain themselves the past year, and pay this heavy tax, reaching, in some cases, as high as \$35,000 for a single establishment. With the tax thrown into the balance of profit, we may soon expect to see the "solid oak-tanned leather of California," forming a large moiety in the amount of that material worked up in the Atlantic States. It is much better to ship it thus, than to follow the old track of twenty years ago, and confine ourselves to the production of "raw hides" merely. We have enough of the raw material to supply our home market, and fill, with the balance, an important item in our annual record of exports.

LECTURES ON COMPOSITION AND ORATORY. Prof. A. Laynes commenced a course of academic lectures on these subjects, on Tuesday last, at Assembly Hall, corner of Kearny and Post streets. They will be continued on Tuesday and Friday evenings until the course, consisting of eight, is complete. These lectures are spoken of in the highest terms by competent judges.

## Communications.

IN THIS DEPARTMENT we invite the FREE DISCUSSION of all proper subjects—correspondents alone being responsible for the ideas and theories they advance.

[Written for the Mining and Scientific Press.]

## Plumbago--Graphite--Black Lead.

BY DR. L. LANSZWEERT.

[Continued from Page 82.]

## GRAPHIC OR GRAPHITIC ACID.

On submitting graphite several times to a high temperature, with a mixture of chlorate of potash, and fuming nitric acid, Mr. Brodie obtained a product under the form of small yellow scales, transparent, crystalline and brilliant, which were insoluble in the acids, but capable of combining with the alkalies; presenting, in fact, the characteristics of an acid, from whence is derived the name of *graphic* or *graphitic acid*.

There is not room in the space allotted to these papers, to detail all the advantages derivable from this physico-chemical process; but it is evident that thereby the varieties of graphite, of inferior quality, can be made to rival, in fineness and purity, the best samples of natural graphite. We can allude to one or two facts only.

## THE SUPERIORITY OF PURIFIED GRAPHITE.

The superiority of pencils manufactured with this substance, deprived of all its hard and scratching impurities, and thus rendered a uniform and pure graphite in its whole mass, must be conceded. The superiority of the so purified and infinitesimally divided graphite, over the ordinary graphite or plumbago, even in its purest state, for glazing or lustering gunpowder, must be evident to every person acquainted with that operation.

It is well known that the rapidity of the inflammation of gunpowder depends on the fineness of its granulation. The finer the grains of powder are, the more rapidly will it burn—it may even be so finely granulated that it will explode with such rapidity as to burst the weapon. But a distinction must be made between powder in *grains* and powder as *dust*. In the former the flame is rapidly communicated to the mass through the interstices of the grains; in the latter it can only be propagated from molecule to molecule. Hence, the inflammation of fine-grained powder is *rapid*; while that of fine dust powder is *slow*.

To prevent, as much as possible, the attrition of the grains of powder by which this deteriorating dust is formed, is one of the processes of manufacture. To this end it has been found advantageous to glaze them with some substance. Graphite has been used for this purpose, which not only prevents the trituration alluded to, but has also been found to prevent the absorption, by the powder, of humidity from the atmosphere. Graphite, employed for this purpose, should be of the purest quality. Experiments have proved that there is a notable economy in the use of purified graphite for this purpose over the ordinary levigated or pulverized article. Such a series of experiments have been made under the direction of the well known chemist, Mr. Abel, at the Royal Powder Manufactory at Waltham Abbey, England.

In these experiments the difference of rapidity of explosion was shown in observing the propulsive effect produced by three equal proportions of the same powder. First powder, not glazed; second powder, glazed with ordinary purified graphite; third powder, glazed with natural graphite. The same mortar and equal charges were employed. The mean result of six charges, fired with each of the above different varieties of powder, exhibited the following explosive values:

First powder, not glazed.....353 feet.  
Second powder, glazed with purified graphite.....327 feet.  
Third powder, glazed with ordinary graphite.....295 feet.

Thus proving the value of purified over ordinary graphite. M. Abel is of the opinion that by employing a more perfect pro-

cess for purification, by which the lustering or glazing could be made *thinner*, a proportionate increase in the rapidity of inflammation could be obtained, and a coarser granulation could be admitted for specific varieties of powder.

The purification of the native graphite is one of the most important difficulties to be overcome in the manufacture of graphite crucibles, or electrical conductors for galvanic batteries; and one which must be thoroughly studied and understood by any person attempting to produce such articles from the California mineral. The presence of an oxide of iron, together with silica, generally found in graphite, is a great drawback to the refractory quality of crucibles, their tendency being to form a fusible glass. Crucibles of absolutely pure graphite, simply protected by a superficial, silicious varnish, will support a higher temperature than any other substance usually at our disposal.

## PURIFIED GRAPHITE AS AN ELECTRICAL CONDUCTOR.

The superiority of purified graphite, over that not purified, as a conducting medium for electricity, has been experimentally demonstrated by Dr. Mathieson, who has used the prepared and solidified plates, prepared by Brockdon's process, with the following interesting results:

The conducting power of silver being.....1.000  
Purified graphite of Ceylon gives.....0.0693  
Non-purified, ordinary graphite of Germany.....0.0039  
Coke of the gas factories.....0.0038  
Coke used in Bunsen's batteries.....0.0024

It will be seen from the above, that the electric conducting power of the purified Ceylon graphite is nearly eighteen times stronger than the ordinary graphite of Germany and the coke of the gas factories, and more than twenty-eight times as strong as the coke used in Bunsen's batteries.

Another series of experiments should be made to ascertain whether the cohesion of artificially solidified graphite is sufficient for its application to the manufacture of crucibles and galvanic plates.

## SOURCES OF GRAPHITE.

Some notice concerning the past, present and future sources of graphite, will afford, without doubt, much satisfaction to those interested in this branch of industry.

Graphite is found usually in primary or transition rocks. At Barrowdale, England, it occurs in nests, in a greenstone rock, which constitutes a bed in clay slate. In Glen Heath Farrar, in Invernesshire, it occurs in gneiss. The Barrowdale mine is especially interesting, and until lately has supplied most of the mineral for English pencils. It is located about six miles from Keswick, and is about half way up a mountain two thousand feet high, and somewhat difficult of access. Some of the nodules procured are pure plumbago; while others have particles of iron ore adhering to them. From the small supply of the material, and the high price which it commands in the market, the mining operations are conducted with much caution and secrecy. This has led to a very stringent set of rules for working. The mine is now nearly exhausted. A material for pencils is very much used, especially in France, made of plumbago mixed with very fine clay. Any required degree of hardness can be given to the composition, by varying the proportion of the ingredients.

Wolf's "purified lead pencils," sold in London, have thirteen degrees of hardness. Mr. Brockdon, and others, manufacture pencils in which the *hardness* and the *blackness* vary in any desired degree.

In the coal formation near Cummock, in Ayrshire, it is imbedded in greenstone, and in the columnar glance-coal.

A variety, nearly as pure as that of Cumberland, but more amorphous and friable, occurs at Passau, in Bavaria, from whence large quantities are exported to England, especially for polishing purposes.

The crucibles of Passau are much in demand, but they are now of an inferior quality, compared with those of ten or twenty years ago, when they could be used for thirty operations, while at the present day they do not stand more than eight or ten. The material from which these crucibles are made, does not properly bear the name of graphite—it is gneiss, containing only 35 to 48 per cent of graphite.

Deposits of lamellary graphite are found in Hindoostan; in the north, *i. e.* in the Himalaya mountains; south, in Travancore, and abundantly in the island of Ceylon. This latter is remarkable for its purity, containing only minimum quantity of 1.2 of silicious ashes.

In 1862, 2,084 tons of plumbago were shipped from Ceylon, and of these, no less than 1,736 tons were brought to England. Most of this quantity is probably used by the Patent Plumbago Crucible Company, at

Battersea, London, who also employ the Stourbridge clay. In the same year the price of Ceylon graphite was £10 per ton; at the present time it is worth £25.

Lately, Spain has exported to England considerable quantity of a good quality of graphite.

A deposit of graphite, which is said to be very abundant, has lately been discovered by an enterprising Frenchman, M. Alibert, in the Batongal mountains, south of Siberia, near the confines of China.

At the London Exhibition of 1862, the Russian department made a magnificent display of articles manufactured from Siherian graphite. In case the deposit of graphite in Siberia should prove to be as rich as proclaimed by M. Ailbert, the English manufacturers could be supplied at reduced prices. It should be stated, however, that the superior quality of graphite mined in the Siberian locality, is obtained with a large amount of an inferior quality; but the latter, according to assays made, could be easily and completely purified.

The graphite of Barrowdale, above referred to, is sold mostly by auction, at prices ranging from thirty-five to forty-five shillings per pound. According to Dr. Ure, the net produce has, in the six weeks annual working, of some years, amounted to 30,000 to 40,000 pounds.

As the writer of the foregoing has been unable to procure samples and data of the California graphite, so as to submit the same to proper assays and purification, to ascertain its value in comparison with that obtained from other localities, it is to be hoped that, with the spirit of California energy, this valuable product will not be suffered to lie dormant, and that at some day not far distant, we may be able not only to export this mineral, but also to manufacture our own crucibles, fire-bricks, etc., for which we are now dependent on foreign markets.

## Cement Mining in Placer County.

FROM AN OCCASIONAL CORRESPONDENT.

MESSEURS. EDITORS:—You have asked me for some jottings with regard to the gravel claims, since my return from the interior. As the Yuba and Nevada county claims have been pretty well ventilated, I herewith give you some items from a range of claims at Forest Hill, Placer county, which the public know but little about. Why these rich claims should not be better and more generally known, I don't understand, unless the owners thereof have done so well that they prefer to keep "shady" to avoid the inquisitive tax collectors.

I will commence on the north, with the Maus claim, which is about three-quarters of a mile from Forest Hill. The eastern boundary of this claim is some 2,000 feet east of the road leading to Bath and Michigan Bluffs. The western line is a cañon, known as Devil's Cañon, 2,000 feet west of the road, making the claim 975 feet wide by 4,000 feet long. Adjoining this on the south is the Garden claim, 270 feet wide, and same depth with the first—4,000 feet. Next is the Eagle, 165 feet wide; then the India Rubber claim, 200 feet wide; the Alabama claim, 270 feet wide; the Pacific Blue Gravel claim, 950 feet front by 594 feet back. This last has recently erected a 10-stamp mill, now about ready to commence work.

Next is the Gore claim, which takes its name from its shape, being 594 feet at back, and running to a point in front; then comes the famous Jenny Lind, 400 feet front, running through to Devil's Cañon. The front part of this claim has already yielded \$1,100,000; the tunnels have caved in, and the back remains unworked, which is richer than the front.

Next adjoining is the New Jersey claim, say 400 feet front by 4,000 feet deep and 650 feet broad, on rear line, as one of its sides run going. It is opened by a main tunnel 2,800 feet long, with lateral drifts of 1,200 feet more, making 4,000 feet in all. This claim has produced \$850,000, and is said to be the best opened claim on the Pacific coast. In running the main tunnel, eight distinct streaks of rich gravel have been struck, resembling ancient river beds. From one spot of 400 by 500 feet, seven feet high, the above mentioned amount of \$850,-

000 has been taken. An airshaft was started on this claim to run up to the surface on the hill, a distance of 460 feet; after going up 200 feet it was abandoned, air having been obtained by means of a water blast. The shaft showed the pay gravel to continue for 178 feet above the bedrock, which is an interesting fact to ascertain. All of this gravel could be economically worked by mill process.

Next adjoining the New Jersey claim, is the Independent, 250 feet wide on front, running through, same width, a distance of 4,000 feet; The front part of this claim has paid \$400,000. Next comes the Snyder, 100 feet wide; then the Northwood, 320 feet; then the Boston, 96 feet; next the Baltimore, 1,538 feet front and 1,118 on the back. The latter company erected a 5-stamp mill, found the ground paid well, and then put up an 10-stamp mill, with power for twenty. Adjoining this, is the Hope—first called Little Hope, but since then it has confirmed great hopes. The tunnel in this claim is 1,800 feet long, developing a splendid claim. A 20-stamp mill is just completed on this claim. This claim is 528 feet front and 975 feet on the back. Next to this is the Uncle Sam, 165 feet wide, and running through the hill. Then comes the Green Spring, 570 feet wide all through. Next is the Oro, 1,000 feet wide, and through.

This claim has a fine 20-stamp mill in operation under the control of Mr. Triglow, from Washoe, who says he would not exchange it for the whole Comstock lode.

Adjoining the Oro, is the Dardanelles, from which over \$2,000,000 has been realized. It is about the size of the Oro claim. This claim was worked with hydraulic pipes, and I am confident that \$4,000,000 was wasted in getting the \$2,000,000. The Americus River, just below there, in its rich placer washings, affords abundant proof of the immense waste from these claims.

I have here given you the names of nineteen claims in Forest Hill, covering an area of ground, 8,800 feet long by 4,000 feet deep or broad. Statistics show a yield from the working of these claims, by sluicing and hydraulics, of about \$9,000,000—or an average of about \$500,000 from each claim. Had this dirt been worked by mill process, it would unquestionably have produced \$36,000,000 instead of \$9,000,000. A large proportion of this dirt that will not pay by washing, will pay well by milling, owing to its being so hard that it does not slack nor break up, even when it passes through several thousand feet of sluices; while in a mill, it will pay equally as well, whether it be hard or soft. These recently erected mills will soon demonstrate all this.

I claim that not one-tenth part of the pay dirt in these claims has been worked out, taking them all together, and I claim that the \$9,000,000 obtained from that tenth which has been worked, should have yielded at least \$36,000,000. And I further claim, that the working of gravel claims is easier, cheaper, surer, and more profitable than quartz.

I can scarcely account for the neglect of these gravel claims, among the seekers after wealth, except it arises from the indifference of the owners to sell, and their carelessness in grouping together statistics, that fairly and fully represent their value. Still, like everything else in California, these claims must go through their dark days or apprenticeship, before even their present owners can clearly appreciate their value. The imperfect mode of working them heretofore, is one great cause of their not being better known; but all that will soon be changed, and gravel claims will take their relative rank in the gold mining of the coast. In my next, I will endeavor to give you some further statistics and other facts with regard to this interesting and important locality.

SKILLED LABOR.—The market value of skilled and educated labor in some departments of mechanics is enormous. In the window-glass factories of Pittsburg blowers and flatters receive as high as \$250 per month; while a few of the most skillful often receive as high as \$20 per day for their services. Some of the melters in steel works receive from \$20 to \$22 per day. Glass silverers, where the largest and most expensive mirrors are required, receive very high wages. In fact, it is said that there are not half a dozen of the really proficient in this class of workmen, on the continent. Not one in a hundred of those who make the attempt can ever arrive at the requisite degree of proficiency in this business to turn out first class work. The skill in both this and steel melting is in the quick and proper perception of the eye. The same remarks are also true of die-cutters for type foundries.

## Mechanical.

## REMOVING BOILER SCALE BY ELECTRICITY.

An instrument for the removal of scale from steam boilers, by means of electricity, has recently been devised by some party at the East, who, or where residing, we have not learned. A lengthy notice of it recently appeared in the *Chicago Railroad Journal*, to which was appended a long list of railroad and other companies who are said to be using the same, and who speak highly of its efficiency.

The instrument is said to be simple in its construction, and one which can be readily attached to any boiler in use. It consists of an insulated copper wire of spiral shape, terminating in a disk of composition metal, from which extend seven sharp, stem-like points or radiators. This electrical apparatus is placed near the top of the steam room of the boiler, where the steam is driest. Its effect is said to be such that all mineral atoms instead of being attached to, are repelled from the inner surface of the boiler, while sedimentary deposits are prevented, and incrustations already formed are displaced, so that they can be blown out by opening the surface or "blow-off cock," once or twice each day. The cost of the instrument, with the privilege of using it, is \$100 for each boiler.

The description of the instrument is rather vague. How it is to be placed in the boiler, whether in electrical connection with it, or through it to the earth, we are not informed. But, however that may be, if it operates as above described, and as a great number of respectable testimonials say it does, it is a very valuable discovery. The damage from "scale" in boilers, in many places, is exceedingly troublesome and costly. The cost of cleaning and the stoppage of works for that purpose; the loss of heat through the non-conductivity of the scale, to say nothing of the rapid deterioration of the boiler in consequence, or the great loss of property and life from explosions brought about thereby, in many parts of the country, is a very heavy tax upon all steam operations, whether in steamboats, railroad locomotives or stationary engines. We hope soon to learn something further of this reported discovery or invention, when we shall make further allusions to it.

**A SPLIT SPIKE.**—The latest novelty in the railway line is a split spike, so constructed, that when it is driven into the sleeper, the two prongs will diverge—thus, when driven home, occupying a place in the wood like the diverging roots of a tooth in the jaw. With a  $4\frac{1}{2}$  inch spike, the prongs diverge about  $1\frac{1}{2}$  inches. By the use of this contrivance, a much lighter spike may be used to give the same solidity to the work. The saving in a mile of railroad construction is 1,750 pounds; while the power of tension of the split over the common spike is more than three to one. Experiments have proved that the power required to draw a "snake-headed" split spike, which is driven outside of a rail, is about 5,986 pounds; that required to draw a round-headed split spike which is driven through an eye in the flange of the rail, is 7,656 pounds; while the power required to draw a spike of the ordinary construction is generally less than 2,000 pounds. The split spike can be drawn, however, and when drawn, its two legs can be readily brought together again by one or two blows with a hammer, when it can again be driven with as much facility as an ordinary spike. This invention is illustrated in the *New York Artisan* of January 9th, 1867, and was patented by Launcelot Kirkup, of Brooklyn, N. Y., January 2d, 1866. The invention has been sold to the Bolt Machine and Spike Company, H. A. R. Moonat, President, 71 Broadway, New York city.

**MANUFACTURES AT THE SOUTH.**—Eleven cotton mills are now in successful operation in South Carolina.

**WOOD SUPERSEDED IN THE CONSTRUCTION OF RAILWAYS.**—While the Bessemer steel is pushing out iron in the making of rails, iron, on the other hand, is being substituted for wooden sleepers, and every day proves the advantage of the latter. In 1862, Herr Heusinger von Waldegg, in a work entitled "Die eiserne Eisenbahn," proposed an elaborate plan for substituting iron for wood in all accessories and appurtenances of railway lines. It appears that his system is gaining ground in Germany. An experiment of forming a line entirely of iron is being tried at the present moment on the Rhenish Railway, near the Coblenz Station, by the director of the company, M. Hartwick. The rail is of the Vignoles form, with a case of the ordinary width, but nearly ten inches high. The weight of the rail is about 1 cwt. per meter, or 34 lbs. per foot; it lies directly on the ballast, and the two irons of the same way are simply connected by stretching rods of round iron,  $1\frac{1}{2}$  inches in diameter, bolted close up underneath the head of the rail. This rail resembles the Barlow rail, and the reputation of M. Hartwick as an engineer is considered a guarantee of its success. The Mediterranean Company has ordered of the Menans Iron Company, in Franche Comté, ten thousand iron sleepers. Those to take the joints weigh 118 lbs., and the others 85 lbs. each; the prices are 13f. 60c. for the former, and 10f. 50c. for the latter. In other words, they will cost just about \$10 a ton, delivered at the railway station. These sleepers are now on trial on the main line, near the station of Maison Alfort. The same works have also received an important order from the Northern Railway of France for 6,000 iron sleepers at 9f. each, delivered at the company's stations; each of these sleepers weighs 77 lbs., which brings the price up to about \$10 2s. 6d. per ton.

**PLANING CURVED SURFACES.**—Hitherto it has been found impossible to adapt the ordinary planing machines for curvilinear planing, but at length this problem has been solved by Mr. Middleton, the head of the machinery department in Chatham dockyard, who has succeeded in planing the whole of the curves and angular surfaces of the iron steam-piece for the Monarch, with no other appliances than the common planing machine. —*Engineer.*

Links for locomotive valve gear have been planed for years in our machine shops on common planers, and by half a dozen different methods. It is no trouble at all. A common way is to take the vertical screw out of the tool holder, and attach a rod to the slide, with the bottom of said rod working in a curve of the required radius formed in a piece bolted to the bed of the planer. *Scientific American.*

**HOW TO STRAIGHTEN HARDENED STEEL.** To straighten steel after it has been hardened and tempered is a great annoyance to the machinist. It is one thing to finish a tool or mechanical appendage requiring hardening, and another to bring it out, hardened as it should be, right. Many a drill, turning tool, tap, etc., is ruined simply for want of knowledge of this art. To be sure, the bulk of the responsibility rests with the temperer or hardener; but what they fail in, may in many cases be remedied by knowledge of a simple fact. To straighten a piece of steel already hardened and tempered, heat it lightly, not enough to draw the temper, and you may straighten it even on an anvil, if not really dead cold, by a hammer; but it is best to straighten it between the centers of a lathe, if a turned article, or on a block of wood with a mallet, where the article, cold, would break like glass. Warm, it will yield readily to such blows as are said to kill the devil easy.

**MACHINE VS. HAND LABOR.**—The Lowell factories employ but 13,115 persons—8,218 women and 4,897 men—to do all the work of carding, spinning, dressing and weaving for 11,358 looms, cotton and wool. To keep these looms employed, about 404,000 spindles are required. To accomplish the same amount of work by the old process of the hand cards, spinning wheel and hand looms, would require nearly or quite one and a half millions of operatives!

**BENNINGTON, VERMONT,** has the most powerful water fountain in the world. At the first trial it threw water to the height of 115 feet. The water is conveyed in iron pipes a distance of 6,600 feet, the fall in the whole distance being 305 feet.

**HOT AND COLD BLAST.**—An inquiry instituted by the British Association has determined the ratio of strength in hot-blast iron as 1,024.8, and of power to sustain impact as 1,226.3, to 1,000 in cold-blast iron.

## Scientific Miscellany.

## Planetary Life.

The fact that the earth, with all the planetary members of the solar system, was once in a condition of extreme heat, is now pretty generally acknowledged among scientific men. The cooling down of each of these masses of matter has been gradual, and more or less modified by their various distances from the radiating influences of the sun, and each other. The smaller interior planets, Venus and Mercury, have still a temperature greatly exceeding that of the earth; and in which no organized vitality can exist.

Professor Loomis has suggested the idea that organic life in the planets Uranus and Saturn has long since passed away, while the condition of Jupiter is doubtful. In all probability Mars is, like the earth, inhabited, and possesses a climate not unlike our own. The telescope has rendered it quite certain that snow and rain fall there, as here. The snow-belt is visible, like that on the earth, approaching the equator in the winter of that planet, and melting away to near the same latitude as it does on the earth during the summer months. In all probability Mars and the earth are the only two planets in our system which are inhabited. The two outer planets have doubtless accomplished the object of their creation; while the two interior ones have yet to cool for some millions of years, before they become fitted for organic life.

That the planets were originally projected from the sun, there is now a very general belief; that they are gradually approaching that luminary, is in all probability an astronomical fact, although the most careful observations hitherto made, with regard to the movements of the earth, have failed to detect any such movement on the part of our planet. But then we should recollect that the period of a thousand years or so, during which accurate observations could have been made, is but an instant in the great cycles by which the origin and existence of systems are measured.

**LAMP EXPLOSIONS.**—It is estimated that five thousand lives have been lost in the United States from lamp explosions. Many were killed, years ago, when the various burning fluids, under the general name of camphene, was first introduced; but perhaps an equal number have fallen victims to casualties resulting from explosions of kerosene. The most general cause of these explosions is the use of an inferior quality of oil, which generates a gas which explodes at a low temperature, or on the least application of flame. Many such occur by blowing out the lamp; the flame in the act is blown down the globe, which is filled with an explosive mixture of gas and air, which often proves terribly destructive, chiefly by scattering the burning liquid over the person of the unfortunate victim.

**ARTIFICIAL CRYSTALLIZATION.**—Mr. E. Fremy, in a communication to the French Academy of Sciences, describes various methods for slowly precipitating certain chemical compounds which are amorphous, owing to the suddenness of their formation, thus enabling him to obtain them in a crystalline form. In some cases the bodies to be decomposed were introduced into liquids of different density containing gum, sugar, gelatine, etc.; in others, they were placed in vessels of wood or unglazed porcelain. He also had recourse to the Osmose process. Thus he succeeded in obtaining crystals of sulphate of baryta, carbonate of lead, sulphate of lead, sulphate of strontia, carbonate of baryta, borate of baryta, chromate of baryta, oxalate of lime, magnesia, and several sulphides. He did not, however, succeed in obtaining pure quartz by the reaction of alkaline silicates on certain acids.

**LEMON TREES.**—It is said that lemon trees grown from the seed will never bear unless they are grafted; at least in any country where they are not indigenous. The mode of grafting is the same as with the apple tree.

## STRUCTURE OF THE HEAVENLY BODIES.

A lecture before the British Association on the results of spectrum analysis, as applied to the heavenly bodies, by William Huggins, F. R. S., lately published, concludes as follows:

1. All the brighter stars, at least, have a structure analogous to that of the sun.
2. The stars contain material elements common to the sun and earth.
3. The colors of the stars have their origin in the chemical construction of the atmospheres which surround them.
4. The changes in brightness of some of the variable stars are attended with changes in the lines of absorption of their spectra.
5. The phenomena of the star in Corona appear to show that in this object at least great physical changes are in operation.
6. There exist in the heavens true nebulae. These objects consist of luminous gas.
7. The material of comets is very similar to the matter of the gaseous nebulae, and may be identical with it.
8. The bright points of the star clusters may not be in all cases stars of the same order as the separate bright stars.

It may be asked what cosmical theory of the origin and relations of the heavenly bodies do these new facts suggest? It would be easy to speculate, but it appears to me that it would not be philosophical to dogmatize at present on a subject of which we know so little. Our views of the Universe are undergoing important changes. Let us wait for more facts, with minds unfettered by any dogmatic theory, and therefore free to receive the obvious teaching, whatever it may be, of new observations.

**ORIGIN OF ANTHRACITE.**—Doctor Percy, F. R. S., in his tenth lecture on Chemical Geology—after describing an experiment of Daubrée, who subjected fragments of fir-wood, in a close tube with water, to a high temperature and pressure, and thus transformed the wood into a black mass having a bright luster, and resembling anthracite—proceeds to say: It has long been supposed that bituminous coal is converted into anthracite simply by application of heat; but something more than this is required to satisfy the conditions, for if it were simply a matter of heat, we ought to get, not anthracite but coke, also a proportionate increase in the quantity of fixed organic matter, or ash, in the coal. It seemed to him there must have been some other condition obtaining in order to account for the conversion of bituminous coal into anthracite. He believed that water played an important part in this conversion, that anthracite has been the result of thermo-hydric or hydro-thermic action; and that water has in some way or other removed to a large extent the inorganic matter or ash.

**TOUGH SOAP-BUBBLES.**—Those who have experimented with the ephemeral refracting spheres blown from common soap and water, will be glad to know that bubbles of extraordinary size and strength can be formed from a mixture of oleate of soda and glycerine. They may be kept on glass or under bell-jars for twenty-four hours. When dropped upon the floor they rebound like a ball. If carefully cut open with a pair of scissors, wet with the solution, smaller spheres may be blown inside. Under the microscope the movements and iridescence of a small bubble present many beautiful changes.

**PERCHLORATE OF THALLIUM.**—Prof. H. E. Roscoe regards this salt as isomorphous with the potassium and ammonium perchlorates. The angles observed by Mitscherlich, in case of the latter, agree exactly with those of the crystalline thallium perchlorate. The isomorphism of ammonium and thallium sulphates having been previously determined, these resemblances in structure, as well as the fact that thallium alum has been formed, furnish strong ground for placing thallium in the group of alkaline metals. Although it is devoid of prominent alkaline characteristics, doubtless the similarity in the structures of the salts mentioned, arises from the fact that it, like all the alkaline metals, is monatomic.

**TO RESTORE STAINED GLASS.**—M. Cheveret states that old and dim stained glass of windows can be restored to its original brilliancy by a simple process. The glass is taken from the window and plunged for several days in a weak solution of carbonate of soda; it is next washed in clean water, and afterwards dipped for some days in a solution of hydrochloric acid sp. gr. 1.080. In this way the colors become as beautiful as when they were first transmitted.

## New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**WOOD SAWING MACHINE.**—At a recent meeting of the American Institute, Mr. Havens exhibited a small model of a machine intended to take the place of the buck-saw. A working model would be about five feet high; it works by a crank and a cam; the saw is a part of a circle, cuts both ways, and is said to saw eight cords of wood a day. How hard it works is not stated. The cost to manufacture is from \$8 to \$10; the retail price, \$30.

**EXTRACTING WATER FROM THE AIR.**—C. J. Bingham, residence not given, writes to the American Institute that he has invented a plan for taking water out of the air for the use of families and of ships at sea. He adds that he is poor, and seventy-two years old, that he has suffered thirty or forty years from paralysis, he wants a patent or premium from Congress so that he can get a home for his great discovery, and he thinks the Institute the party to direct him. The above is published in the New York Tribune's report of the proceedings. The report does not intimate what action, if any, would be taken.

## PATENTS RECENTLY ISSUED.

**QUARTZ CRUSHER.**—J. Varney and A. Rix, San Francisco, Cal.: Claim the combined use of the wrought-iron binder, k, the toggle-bar, M, and jaws, B and E, constructed and arranged substantially in the manner and for the purposes set forth.

**PUMP VALVE.**—W. D. Hooker, assignee to himself and Volney Cushing, San Francisco, claim an improved pump valve, constructed with guides upon its sides, arranged as and for the purposes set forth.

**MARINE MOTOR.**—W. P. Kirkland, San Francisco, Cal., claims a pipe, having stop-cocks, water-wheel, and water-pipe, in combination with any suitable device connected with the said water-wheel for transmitting its power, when arranged together substantially in the manner and for the purpose specified.

**AMALGAMATOR.**—Syranus Standish, Pacheco, Cal., claims, 1st, The spiral-shaped flanges or lips, of the rotating mill-arms, substantially as and for the purposes specified. 2d, The shoes, hung to the mill-arms, so as to be susceptible of a lateral play upon such arms, substantially as and for the purpose described. 3d, The shoes, having spiral-shaped flanges or lips upon their outer ends, as and for the purpose set forth.

**BEARINGS FOR SHAFTS OF STEAMSHIPS.** George K. Gluyas, of this city, devised the arrangement of a frame, inclosing adjustable blocks, guided by slides and blocks, and combined with rubber springs and adjustable screws, substantially as set forth in his specifications.

**WASHING MACHINE.**—John S. Hittell, of San Francisco, claims a combination of movements as an improvement to a washing machine.

**PUNCH.**—Richard Hughes, Virginia City, Nev., claims a holder, having spring-arms or jaws, with socket to receive needles, and separating plates, substantially as described.

**MATERIAL FOR STUFFING MATTRESSES AND FOR OTHER PURPOSES.**—H. R. Hildreth and others, Dutch Flat, Cal., claim, 1st, As a new article of manufacture and as a substitute for the ordinary curled hair, the fiber of the soap plant, when properly treated and manipulated therefor. 2d, Treating the fiber of the soap plant substantially as described and for the purpose specified.

**STEAM GENERATOR.**—W. D. Andrews, New York city, claims a boiler having a fire-place extending over its entire horizontal area, with the exception of a narrow water-space surrounding it and a series of tubes, whether one or more, passing horizontally through the water-space above the fire-place, when the said fire-place and the said tube or tubes are connected by and communicate through a combustion chamber formed outside the boiler having openings, adjustable or otherwise, for the admission of atmospheric air thereto, and an opening or openings passing through the water-space surrounding the fire-place and communicating with the latter, when the whole is constructed and arranged so as to operate substantially in the manner described and for the purpose specified.

The Mining and Scientific Press commenced a new volume January 5, on a new type of California make—the first of the style, the editors say, which has yet appeared in print on this coast. It looks well.—Humboldt Register.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
February 16, 1867.

## CITY STOCKS.

More than usual activity has pervaded the city share market since our previous reference, particularly in Insurance Company shares. Pacific Ins. Co. sold at \$156 per share. At a meeting of stockholders, held on the 11th instant, this company increased its capital stock from \$750,000 to \$1,000,000, and the number of shares from 7,500 to 10,000. Union Ins. Co. obtained \$107.50; National, \$73, and Fireman's Fund, \$10.50 per share. S. F. Gas stock sold to a very considerable extent at \$66.50@67.50. This company paid its usual monthly dividend yesterday. State Telegraph Co. sold at \$32. The Bank of California disbursed its usual monthly dividend of 1 per cent. on its capital stock of \$5,000,000 yesterday. The Sacramento Gas Co. paid its usual dividend of  $\frac{1}{4}$  per cent. per month on the 1st instant, and the Spring Valley Water Co. disbursed the same amount in dividends on the 10th inst. North Beach and Mission R. R. also paid to its shareholders a dividend of  $\frac{1}{2}$  per cent. per month on Feb. 10th. Cal. Steam Nav. Co. sold at the close at 61 @ 61 $\frac{1}{2}$  & cent.

At an election for Directors of the Odd Fellows' Savings Bank, held on Tuesday evening, February 12th, the following gentlemen were elected: Martin Heller, Henry B. Brooks, Abram Block, John Cammet, Charles N. Fox, David Hunter, George T. Bohen, Daniel McLaren, Moses Selig, Wm. A. Woodward, David Meeker, Charles Bernard, Jos. Brandenstein, Benjamin Hagan, Henry C. Squire, John F. Miller, John F. Morse, Charles Metzler, Frederick Fortmann, Newton Booth, Aaron A. Sargent, and Benjamin Price.

## MINING SHARE MARKET.

Considerable activity has characterized the market in most mining stocks, and large sales have been made, for the most part at lower rates. Advices from the leading mines continue favorable, and the improved condition of the roads will add very materially to their receipts of bullion. The judicial proceedings recently instituted in Nevada against the Savage Company have been the subject of much comment in mining circles. If we are correctly informed, there is but little intrinsic merit in this adverse claim, and the recent heavy "short" sales may afford some clue to the vigorous efforts of interested parties to bear the stock.

**HALE & NORCROSS**—has not been in the market for months past. During the present week \$2,500 was bid. The bullion received by the company during the month of January amounted to \$94,440.33, being the yield of 1,746 $\frac{1}{2}$  tons of ore, and showing an average of \$54.06 to the ton. Of this amount of ore, 36 $\frac{1}{2}$  tons were first-class, yielding \$8,131.31, or an average of \$223.29 per ton. On February account, up to the 10th inst., 1,474 tons of ore—42 tons of which are first-class—have already been reduced. This company disbursed to its shareholders yesterday \$125 per foot (\$50,000), leaving a net surplus on hand of over \$130,000 after paying this dividend.

**SAVAGE**—has steadily declined during the present week, selling at \$1,910@1,930, then at \$1,800@1,700, and closing yesterday at \$1,790. Owing to the peculiar character of the legal difficulties with which this company has at present to contend, the Superintendent's time has been greatly monopolized, and we are without a very extended report for the week ending February 9th; however, we learn that during that week 1,182 tons of ore were extracted from the mine, the assay value of which is given at \$33.62 per ton. We are also informed that the sixth and seventh stations are looking as well as formerly. The good quality of ore heretofore obtained from the south mine, it is said, continues to be maintained, and the lower station is producing the richest.

**YELLOW JACKET**—has been in active demand, advancing from \$810 to \$865, then falling to \$795 and \$740, and closing at \$785. From a statement made by this company, we obtain the following summary of their operations during the month of January:

RECEIPTS.	
Bullion.....	\$156,200 37
Other sales.....	8,498 00
Balance on hand Dec. 31, 1866.....	99,760 38
	\$264,458 75
DISBURSEMENTS.	
January dividend.....	\$ 60,000 00
Ordinary expenses, including December labor account.....	194,639 33
Extraordinary expenses.....	7,020 20
Cash on hand.....	2,797 22
	\$264,456 95
LIABILITIES.	
Am'ts outstanding.....	\$155,424 39
Cash.....	2,797 22
	\$158,221 61
ASSETS.	
In Bank.....	\$131,896 27
Supplies, etc.....	26,325 54
	\$158,221 81

**CROWN POINT**—has met with more than usual inquiry, opening at \$1,000, then selling at \$975@940, and at the close obtaining \$855. This company disbursed a dividend of \$100 per foot to its shareholders yesterday. Deducting the \$60,000 required for the dividend, leaves a cash balance in the treasury of \$50,000. During the first week of the present month, 897 tons of ore were taken from the mine. It is said that the developments in the southern portion of this claim are looking better than formerly. At the present rate of progress made in the shaft, it is thought that the 500-foot station will be opened about the 20th instant.

**GOULD & CURRY**—sold early in the week at \$530@540, then at \$510, seller 3, and at \$530@510, and closed yesterday at \$530. The upper works of this mine are said to continue in a good condition. This company at present only employ their own mill in the reduction of ores, and the management of all its affairs are now on a much more economical basis than formerly, the expenditures being about \$45,000 per month. The main shaft is being sunk with great vigor, and it is thought, under favorable circumstances, that the sixth station or 1,025-foot level will be opened in April next. The bullion returns from the 1st to the 14th instant amounted to about \$32,000.

**CHOLLAR-POTOSI**—opened at \$232, receded to \$228, advanced to \$231, then sold at \$220@215, and closed at \$221. Little work was done under the Blue Wing station during the week ending February 9th; however, the drift has been widened preparatory to the commencement of extracting ore. A winze is about being started in a deposit of ore in the first station, new shaft, to connect with the second station. The ore sent to custom mills during the week closing with Feb. 9th, amounted to 1,060 tons.

**OPHIR**—improved from \$145 to \$202.50, then sold at \$200@195, and at the close realized \$193. The tenth station drift east on the 11th inst., was in 46 feet, the distance made being at the rate of 1 $\frac{1}{2}$  feet per day during the previous week, and the expense so far having been \$25.82 per foot. The west drift on the ninth level, carries green stone, and the drift on the eighth level has reached Mexican ground.

**IMPERIAL**—realized \$180@185, then sold at \$175, and closed yesterday at \$163. This company disbursed \$12 per share in the shape of dividends to its stockholders yesterday. The first clean-up of the present month amounted to \$19,250.

**EMPIRE**—advanced from \$175 to \$180, and yesterday \$180 was bid.... **BELCHER** receded from \$130, seller 10, to \$125, then sold at \$130.... **BULLION** fell from \$22 to \$14.50, and at the close yesterday sold at \$17.25.... **CONFIDENCE** was actively dealt in during the present week, selling at \$28, buyer 10, then at \$16@17, closing at \$18. An assessment of \$25 per share was levied on this stock on the 11th inst.... **OVERMAN** sold at \$24, then at \$20@18.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$859,565.

**INCREASED DUTY ON COPPER ORE.**—Copper ore will soon be admitted into this country an *ad valorem* duty. Mr. Connors has introduced a bill to change the *ad valorem* to a specific duty of three cents a pound. Such a change will be equivalent to a prohibition; for a duty of three cents per pound on first-class copper ore, as it ordinarily runs, would approximate so nearly to the full value of the copper which it would contain, as not to leave sufficient margin to pay for smelting and refining it.

A **BROOM FACTORY** has lately been started in Portland, Oregon, which turns out one thousand brooms per week. The design is to supply the home market with this useful implement, which has of late been furnished from California.

## The New York Metal Market.

We quote from Winterhoff's *Metal Circular*, dated New York, December 31, 1866:

**TR**—is quiet, but firm, at 21 $\frac{1}{2}$ c. (gold) for Straits, 23 $\frac{1}{2}$ c. for Banca, and 21 $\frac{1}{2}$ c. for English. The consumption has been larger than in any former year. From the East Indies 10,000 slabs are on the way, of which 6,000 slabs have been sold to arrive. In Europe the stocks are very large, but the shipment from the East Indies are falling off, whilst the price is so low that it begins to attract the attention of speculators. Importation for the month, 5,700 slabs Straits, and 25 tons English. The imports of 1866 at Boston and New York amount to 107,500 slabs, against 80,550 slabs in 1865, and 35,700 slabs in 1864. The stock now on hand in Boston and New York is estimated at 30,600 slabs, against 19,700 slabs, December 31st, 1865.

**SPELTER**—is very dull, although more firmly held in consequence of the advance in London. Silesian and Stolberg are quoted at 6 $\frac{1}{2}$ c., gold. The domestic article does not appear in any quantity in the market, but is converted into sheet zinc by the producing companies. The importation for the month is 105 tons. For the year, 4,375 tons, against 2,400 tons in 1865.

**COPPER**—has declined again to 26c. (currency) for Portage Lake and Baltimore, and 27c. for Detroit, without any business of consequence. In the face of the decline in gold and the discouraging advices from London, no immediate recovery can perhaps be expected. The price is exceedingly low both in Europe and here, but with the first revival of general business it is sure to advance. To-day's price is equal to 19 $\frac{1}{2}$ c., gold, and as the duty of 2 $\frac{1}{2}$ c. is imposed since 1864, must be deducted in order to compare the present price with former years, it is equal to 17 $\frac{1}{2}$ c., gold. The lowest price ever known was 17 $\frac{1}{2}$ c. in 1861; the highest 30c. in 1857. It is exceedingly difficult to form an estimate of the stock and consumption of this year. The Lake Superior mines have probably produced 500 tons more than in 1865, but the Atlantic smelters have not worked steadily. From the Tennessee mines, which promise to furnish an increased quantity of excellent ingot copper, we have received about 1 $\frac{1}{2}$  million pounds. The consumption and production have been for years past nearly balanced, but at the present low prices the Lake companies do not pay, and many will have to abandon mining should there be no advance. Copper is always quoted in currency. It was quoted on the 31st January last 42 $\frac{1}{2}$ c. @ 42, declined in May to 28 $\frac{1}{2}$ c., advanced with the rise in gold to 33 in July, and has since gradually declined.

**LEAD**—has been quiet at 6 $\frac{1}{2}$ c., gold, for ordinary foreign. A few small parcels have been sold for one-eighth less. The manufacturers have been supplied by their own importations, and particularly the White Lead factories are well stocked. The importations for the year amount to 27,150 tons, against 13,600 tons in 1865. The consumption in the Eastern and Northern States has been larger than in 1865, but the increase in the deliveries has been mainly occasioned by shipments to the West, where the production from the Galena mines has materially decreased. Since September the demand for the West has ceased.

**OVER THE SUMMIT.**—The Central Pacific Railroad Company are making arrangements to haul 3,000 tons of rails over the Summit the present season, on runners upon the snow. A sufficient quantity of rails will be thus pushed forward to lay the track early the coming spring, from Cisco to the Truckee river. As soon as the heavy work at the Summit is completed, this portion of the line being in readiness, the road will be opened to Crystal Peak, Nevada.

**OLNEY & Co.**, Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 315 Montgomery street, San Francisco. no10

**NATURAL CURIOSITIES FOR CHRISTMAS.**—At No. 522 Pine street, E. F. LOQUIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shell, and Wax Flowers, besides Feathered Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 24113-qr

**Air Pump for Sale.**—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JONAS ROACH, mathematical instrument maker, 522 Montgomery street. 24113-9p

**Favorable to Inventors.**—Persons holding new inventions of machinery and important improvements, can have the same illustrated and explained in the Mining and Scientific Press, free of charge, if in our judgment the discovery is one of real merit, and of sufficient interest to our readers to warrant publication.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Union* of Feb. 9th: We saw, the other day, some fine looking quartz from the Rhode Island claim.

At Boulder Hill, Wade and Harper have been working away all winter in the old Scott's Hill Consolidated Tunnel, and have, we learn, this week struck into the west wall of the Pioneer ledge.

From the *Silver Mountain Bulletin* of Feb. 2d: At the George Washington mine an addition is being made to the mine house, so as to accommodate at least thirty men; and a shaft is being put down, so as to commence stoping, forty feet beneath the second level.

## Amador County.

From the *Ledger* of February 9th: The Garibaldi mine, located near Jackson, is now being thoroughly prospected by Mr. E. Marvin, who represents a company in Buffalo, N. Y. He is making good progress, and in a few days will have some of the rock crushed.

On Wednesday last we were shown substantial proof of the value of the Oneida mine, in the shape of 270 ounces of retorted gold, valued at \$4,500; the result of fourteen days run with twenty stamps, and taken from less than 300 tons of rock. The mill is one of the most perfect in this section of country, and in a few days twenty additional stamps will be put in operation.

Letter from Velcano to the *Times* says: Last month the Golden Gate company took out, with their 10-stamp mill, \$6,400 in a run of fourteen days. Other companies are doing nearly as well. The best quartz section of this region is on Sutter Creek. The Hayward mine is producing as well as ever. The Railroad Quartz company are developing a very rich vein. On the 5th, this company cleaned up \$2,900 from 125 tons of rock. The Mahoney Brothers have an excellent gold-bearing quartz vein forty feet wide. A. H. Reese intends building a new mill on his claim, two miles above town. Messrs. Meader & Co. are running their mill on sulphurets saved at the other mills of the county. The Oneida claim, on the 5th, after a run of two weeks, cleaned up over \$5,000. The mill on this claim had then twenty stamps, now it has forty. Hereafter the company expects to clean up \$20,000 per month. Mr. Downs recently sold one-tenth of the Railroad claim to J. Bartlett for \$3,000. A few days later he disposed of another tenth to Messrs. Bruin & Newman for \$4,000. Still later the last named parties purchased a third tenth interest for \$5,000.

## Calaveras County.

From the *Chronicle* of Feb. 9th: Hepburn & Co's mill, at Railroad Flat, is again in active operation. Work is being vigorously prosecuted on all the claims in that locality, and there will be no lack of rock to keep the mill constantly employed in the future. The good pay obtained from the quartz taken from the New York lead, has had a stimulating effect on the miners in that section.

Angels is one of the most flourishing villages in the county. The Angels Quartz Mining company have erected one of the finest mills in the State on their lead, and have already commenced crushing. The battery consists of thirty stamps, and the mill is supplied with all the latest improvements in machinery for saving gold.

The tunnel to drain Vallecito Flat will be completed in March. It has cost thirty thousand dollars.

Several quartz mills are being erected at Carson Hill. At Murphy's considerable hydraulic mining is being done in close proximity to the town, and a number of quartz lodes are being prospected in that vicinity. Goodell & Co. have developed a very promising lead, and are engaged in building an arastra, which they contemplate having in operation soon. We were shown some very fine specimens of gold-bearing rock taken from the celebrated Silver Elephant claim, near Murphy's. There are a number of other claims being worked in that locality with the most flattering prospects of success.

## El Dorado County.

From the *Placerville Courier* of Feb. 9th: We learn by letter of date January 30th, that Dugan & Graham have struck a very large deposit of gold near a quartz ledge at Latrobe. They are washing the dirt from around the ledge, and think they have already taken out fifteen to twenty thousand dollars, though at work but a short time.

Steeley's old lead, near Grizzly Flat, has recently been sold to New York parties, who

are prosecuting work with vigor, being already down 140 feet. The rock from this lead was worked with an arastra from the surface down forty feet, and yielded over a million of dollars under the management, and the rock which they are now working is richer than any yet taken out. They intend to erect a large mill as soon as the weather settles.

## Kern County.

From the *Havilah Courier* of Feb. 2d: In the Hayt mine (Gen. Grant) the tunnel is in over 800 feet. The company have struck a 2-foot ledge of very rich rock. They have on hand a large lot of quartz, which they will commence crushing as soon as the roads will admit of the hauling of fuel to the mill.

Several of the owners of undeveloped ledges in Clear Creek district, are commencing upon the work of developing their claims.

In Mt. Sinai district (Kelson) the Pettus company realized \$2,400 in bullion from a crushing of eleven tons of rock, on the Roger's mill. The rock was taken from the Hamp. Williams' lode. The company have several hundred tons of rock from this mine ready for crushing, which is believed to be very rich. The company's mill will soon be in running order.

We hear of rich discoveries having been made lately in the Caliente district. It is rumored that a joint steel company has been formed in the Eastern States to open some of the mines in the district, and that the work will soon be commenced. Mr. McKeadney has again commenced work on the Delphi mine. Marsh & Co. are running their mill night and day, crushing rock from the Venus mine, and are realizing exceedingly well. At the present time there is a scarcity of hands in our mining districts. Good miners are in demand.

## Mariposa County.

Gentry's Gulch correspondence of the *Mail* says, Feb. 9th: H. Coward's mine is being worked through tunnels, an upper and lower one, which are about seventy-five feet apart. The lower one does not give to exceed two hundred feet upon the vein to its outcrop. Above his present level there is ore for about a year's crushing. This mine is one of those which have furnished rich "pockets." This term, by the way, is one often used with regard to Mariposa mines. But the notion is absurd. It is only from the manner in which they are and have been worked that the conclusion has been arrived at. It now rests with the miners themselves to show to the world that their quartz veins are continuations of pockets in their chimneys of ore. Let them take the courses between what they have heretofore called their pockets, classify the ore, examine and determine its width from side wall to side wall—take their general course—then they have the direction in which their chimney of pay ore runs. By following it, they would, in a short time, astonish the pocket men, by showing to them the richness of Mariposa's chimneys of gold-bearing ore.

Letter to same from Bull Creek has these items: Messrs. Davis and Loomis are sinking on a large vein and taking out some fine ore. Messrs. Munn, Lamb and Shumate are quite sanguine. The small amount of rock taken out glistens with gold, and much of it, upon pounding up in a mortar, literally hung together with golden threads.

Messrs. Jenkins, on the main Merced, are crushing rock with, I believe, satisfactory results. Higher up on the main river, the Ferguson Bros. are taking out large quantities of excellent ore.

In the vicinity of Coulterville quartz mining is being prosecuted with vigor. The Bell McGrew mill is in successful operation.

From the *Gazette* of 9th: In our last week's issue we published an item, stating that the Lafayette company, in Hunter's Valley, had suspended work on account of scarcity of wood at the mill, and owing to water in the mine. The Secretary says the mine is still in operation. The mill has stopped for the purpose of putting in more machinery. They will be able to start up the mill again in the beginning of the week.

Frank Lewis discovered a piece of gold, last week, on his "diggings," on Frank Lewis' crossing, which weighed five ounces. This week he found another in the same locality weighing fifteen ounces.

## Mono County.

Seventeen hundred pounds of silver bullion from the Cornucopia mine, in Blind Spring district, arrived in this city a few days since.

## Nevada County.

From the *Transcript* of Feb. 12th: We understand that a rich strike has been made in Jacobs & Sargent's Green Mountain cement claims at Quaker Hill. The bank of cement is from ten to twelve feet in thick-

ness, and a car-load taken from the bedrock is estimated to contain from fifty to one hundred dollars. A mill was built on this claim last fall, and since that time the owners have been engaged in opening the claim. This rich deposit was struck on last Friday, and the gold is scattered in profusion all through the mass.

From same of 13th: Allison Ranch is quite dull at present, but a small number of men are employed in the mine, all work being suspended under ground, except what is necessary to keep the mine free from water. The mill is kept constantly at work crushing the tailings, an immense quantity of which are collected below the mill and they pay well for a second working.

At Forest Springs, the old claims have been steadily worked and a number of new ones have been extensively prospected. The mining prospects of the place are said to be exceedingly encouraging.

We learn that the miners at French Corral are doing finely. Bird & Smith, after a run of twenty-one days, cleaned up a little over \$5,000. There is some talk of erecting a cement mill in this locality some time during the spring.

In Little York township, at Quaker Hill, Jacobs & Sargent are working several sets of hydraulic claims and the prospect is most encouraging. At Green Mountain, between Quaker and Hunt's Hills, the same parties have just opened on the Blue Lead, and struck first-rate pay. They have a bank ten or twelve feet deep and rich from bedrock to top gravel. At Hunt's Hill several companies are at work and all are doing excellently. Red Dog, which was destroyed by fire last summer, presents a better appearance than ever.

From the *Gazette* of Feb. 6th: Much interest is manifested by the mining population of this county, at the present time, with the prospects of successful mining operations in the old river channels and deep hill diggings.

The success of Craig & Co., who struck the gravel lead on Onestamah Hill, will encourage others to look for it further east. Two or three companies owning claims next above the Nebraska have been endeavoring to effect a consolidation of their interests, and if satisfactory arrangements are concluded, operations will be commenced in the spring. The Harmony and Cold Spring companies are also endeavoring to effect arrangements to open their ground during the coming season.

Same of 8th: Buckman & Currau, in whose claims the explosion occurred some two weeks ago, having succeeded in expelling the gas, have since struck very rich cement. Some of the finest specimens of cement gravel ever found in the county have just been taken from the claims.

The incline in the New York Hill mine is down to a depth of 600 feet, being 290 feet perpendicular, and is yielding from 250 to 300 tons of rock a month. They are having a crushing of 600 tons worked at the Rocky Bar mill. The yield is usually \$35 to \$40 a ton.

Same of 12th: Very rich gravel cement has been struck in the claims of Jacobs & Sargent at Green Mountain.

The Whigham mine is now being opened in the most systematic manner. A new 10-stamp mill is now in course of construction.

Same of 13th: Seventy pounds of amalgam was cleaned up from the Banner mill on Monday, being the yield of six days crushing.

From the *Grass Valley National*: The workmen in the Ophir Hill mine, in running a new drift a few days since, struck a 3-foot ledge, from which \$300 in specimens was obtained. The rock now being taken out shows well in sulphurets, and will average from \$30 to \$40 per ton.

EXCELSIOR.—From the *Meadow Lake Sun* of Feb. 9th: The mill of the Golden Eagle company started on Monday last.

The Gold Run company recently struck rock richer in free gold than any heretofore found in their mine.

## Placer County.

From the *Herald* of Feb. 9th: The abundance of rain that has fallen, causing the ditches to flow full, has given the miners a fine chance for hydraulic mining. We predict a successful mining season in Placer.

From the *Dutch Flat Enquirer* of same date: The Summerset claims are now in full operation.

## Plumas County.

From the *National* of Feb. 2d: Crescent mill is again in full blast. The new dam at Round Valley is nearly finished. Jenkins & Kellogg have put up a 16-stamp quartz mill below the dam.

Premium ledge, at Plumas City, is again being worked. The company are taking out rock as rich as ever, and in sufficient quantities to keep their 24-stamp mill run-

ning. We understand that the returns are about \$1,000 per day.

The upper claim of Bass & Reynolds, at Black Hawk, is being worked with success. The company have commenced cleaning up the bedrock. The prospects are most flattering. The claim of Reynolds & Madden is paying good wages.

## Shasta County.

From the *Courier* of Feb. 9th: At French Gulch, the placer mines are yielding better than usual, and money is plentiful. Some of the claims on Church Hill are paying splendidly, one company taking out as high as \$75 per day.

The Mammoth Company are to remove their mill to the Harrison lode at Quartz Hill. Clear Creek ditch is now in good running order.

The present season has been a propitious one for the miners around Buckeye and Chumtown.

The owners of the second extension of the Red Warrior lode, in the South Fork district, are making preparations to commence work.

The claims owned by Robert Pitt and others, Portuguese Flat, are paying well this winter. A back channel has been found which prospects very rich.

## Sierra County.

From the *Dovnieville Messenger* of Feb. 9th: The Oak Flat Mining Company have lately let a contract for running their tunnel one hundred feet. After a run of fourteen days of the Slug Cañon quartz mill, a clean up gave \$1,017. The Empire Mining Company, at Goodyear's Bar, (Bates & Co.) are taking out from six to eight ounces per day, with six hands. The McCormick boys are about opening the old New York gravel claims at Alleghany.

The Twenty-One Company are taking out rich rock, and will soon start their mill. The Green Back and Oak Flat Companies are also doing well. The Union and Pac Similo are at a standstill, but expect to resume operations in a short time.

## Tulame County.

From the *Columbia Citizen* of Feb. 9th: At Gold Hill and Gold Springs several good claims that have been laid up for the winter have been started again. The Shaghae quartz claim pays a handsome dividend.

The claim of Ames & Co. and of Pierce & Co., at Table Mountain, are in successful operation.

At Saw Mill Flat the prospect for lively times is favorable. King & Diamond, in Red Gulch, and still further on, Dunn, Diamond & Co., are realizing first-rate pay. Rowell, Whiting & Co. are receiving large dividends. Currow, Powers & Co's claim stands high as a uniformly paying claim.

## Yuba County.

From the *North Californian* of Feb. 8th: We are informed by Wm. Smith, of Indiana Ranch, that the owners of the Bateman ledge are now having crushed at Templar mill rock which will pay from forty to fifty dollars per ton.

Ten thousand dollars was the amount taken from the Antone claim, Timbuctoo, in fifteen days run.

John Rice, of Indiana Ranch, has discovered on his ranch a very rich deposit of cement gravel, which extends nearly one mile. One pan of dirt prospected \$1.12.

## ARIZONA.

Mr. Goldwater, a merchant at La Paz, arrived in this city a few days ago, and brings late mining news. The new 20-stamp mill of the Vulture Company, at Wickenburg, has commenced running on the Vulture rock, and is turning out bullion in most satisfactory quantities. A contract has been made with a party to haul twenty tons per day of this rock from the mine to Wickenburg. The old 5-stamp mill, now rented by Mr. Chshenbury, is also running, and clearing several hundred dollars per day. On Antelope Creek, at Weavers', the party holding the richest claim is a Frenchman, named Bertrand, who has done an immense amount of labor in preparing for sluicing as soon as the rains furnish water. Bertrand let on a stream of water for a moment to show the richness of the dirt, and Mr. Goldwater then picked out with a pair of tweezers a small paper boxfull of fine large lumps of gold of the finest quality, which he brings with him. He adds that the Apaches stole his mule while he was doing it.

From the *La Paz Gazette* of Jan. 10th. We are informed by Mr. Rountree, who arrived in town on the 15th from Prescott, that the mill of Mr. Woolsey, which is on the Ticonderoga ledge, on an experiment, after refining their quicksilver, cleaned up from seven tons of unassorted rock, \$987 of retorted gold. The experiment was made for the reason that the parties interested believed the quicksilver not to be good. In refining it they discovered that but one-half was quicksilver. The Ticonderoga is prob-

ably as well prospected, if not better, than any ledge in the vicinity of Prescott, to the depth of fifty feet, and shows well.

Same of 17th: The mill of Mr. Noyes on the Unpqua, will probably be in operation in a couple of weeks. It is of ten stamps, and a good mill; and the mine is asserted to be very rich.

#### BRITISH COLUMBIA.

From the *Victoria Colonist* of Feb. 21: Mr. Milby, who left Wild Horse Creek, Kootenai mines, in November, considers that the best mining camp in the country. There were about seventy-three white men and 275 Chinamen wintering on the creek, and all doing well. Every man had money, and business was brisk. There will be a large number of miners there the next season, and it is believed that other creeks in the vicinity will be prospected to advantage.

At Leech River, there were about twenty men mining, who seemed perfectly satisfied, and expressed great confidence in the results of the next summer's work. Our informant tried about three or four pans of dirt from the bench that will be washed away by the ditch, from which he got from ten to fifteen cents to the pan. The gold is very pretty in appearance and of very fine quality.

#### COLORADO.

From the *Colorado Times* of January 22d: Notwithstanding the bad weather of the week past, the Gunnell company's mill will make a good shipment this week to the East.

Certain claims in Russian and Fall River districts have been sold by the Ayres' Mill and Mining Company for seventy thousand dollars.

Colonel F. W. Ford, of Russian Gulch, has gone East to raise capital for the purpose of working the "South American" lode. This is situated on the south face of Republican Mountain, about three-quarters of a mile above Georgetown. When first discovered, it showed a crevice of about six inches. A shaft has been sunk about forty feet, and the seam of ore has enlarged to three and a half feet. The ore has assayed from \$240 to \$2,000 per ton. The owners recently had one thousand pounds of ore crushed by hand and smelted in Watson's furnace, and obtained 250 pounds of metal, which assayed \$780 per ton, equal to a yield of \$273 per ton of crude ore.

From the *Denver News* of January 23d: The new Ni-Wot mill, in Ward District, will soon be in running order.

A communication from James Creek says: The weather is very fine, and prospecting is continued with great energy. Messrs. Grey & Morrison are at work on their smelter with vigor. Great confidence is felt in this enterprise from Mr. Grey's known experience in smelting the lead ores of Wisconsin. Everything pertaining to the district, we are assured, is cheery, and the miners indulge in bright anticipations of what the coming season will disclose.

#### IDAHO.

From the *Owyhee Avalanche* of Feb. 2d: Tunneling on a large scale will form an important branch of prospecting and mining the coming summer. The Cosmos, New York, and Owyhee and Iowa companies will each run extensive tunnels in addition to their usual mining operations. We learn that estimates with a view to let contracts are now being made.

L. J. Lewis, Esq., superintendent of the Silver Glance Mining company, arrived from New York on last Saturday. He has business connections with the Cosmos company, and his operations will extend to Flint district. The company which he has organized at the East owns several very rich ledges in Flint district.

Letter to same from Lembi has the following: There have been claims opened and worked for a distance of about sixteen miles—some paying two ounces and many more a great deal less. John Aikman & Co. last week took out nearly \$300 on a bar on Ward's Gulch, which is good pay. The principal gulches here are Ward's, Smith's, Webfoot, Jackass, Wright's, Nip-and-Tuck, and Nappy's Creek, in this district. We have four other districts located round here, but I am not well enough posted to name the gulches accurately; all have claims opened and men waiting for spring. There are now about 350 men wintering here, and more coming every day. We have two towns—one called Leesburg and the other Grantsville, with about thirty houses finished and a hundred more on the way.

From the *Idaho Times* of January 25th: The Messrs. Smith—owners of the Laudon ledge—are meeting with unexpected success. Six weeks crushing has yielded more than was actually expended in six months labor in its development. Work in several of the ledges is being pushed forward. The Gambrianus, Illinois, Landon and others,

have men engaged in extracting ore. Tunnels in the immediate vicinity of Idaho City are not worked at present.

#### MONTANA.

From the *Post* of Jan. 19th: We were shown some very fine specimens of argentiferous rock from a lately discovered lode in Jefferson county. The ledge has been named the "Argentum," shows a width of eight feet at a depth of only thirteen feet, and promises fair in silver.

A new gulch was lately discovered about two miles from this city, which, from present appearances, will prove pretty rich. The gulch is named Jones' Gulch, is situated two miles east of Big Indian, and empties into Prickly Pear valley. It is four or five miles long, about fifteen feet to the bed-rock, and the prospects are good for a big thing next season.

The 10-stamp mill of Judge Turnley, situated in Grizzly Gulch, since its commencement of operations in the latter part of June last, has cleaned up \$42,000, being an average of \$7,000 per month. Taking into consideration the disadvantages under which this mill has labored, some of the time being unable to run but half the stamps, it must be confessed that it is good work. The rock crushed was from the Park & Whitlatch Union lodes, and the biggest clean-up was eleven thousand dollars for ten days' running.

The Virginia and Nevada Ditch and Fluming company have consolidated with the Alder Gulch Fluming company, and propose commencing operations as soon as the weather moderates. Mr. McEvily and others have about completed arrangements with capitalists for the purpose of constructing a ditch from the Passamari river to Alder Gulch, large enough to carry four thousand inches of water, for the purpose of fluming Alder Gulch. This ditch, it is estimated, will cost \$200,000, and will pass over miles of ground which prospects well, but cannot now be worked for want of water.

Letter to same from Doer Lodge says: The claims which are opened pay from ten to fifty dollars per day to the hand. Claim-holders will pay from six to eight dollars per day, wages, in the spring. Work will commence some time in the month of March. As to the quartz lodes, they have proved to be rich without a doubt. The Porter Bros. & Co. have put up a smelting furnace, and run out several thousand pounds of metal.

From the *Herald* of January 10th: Rich diggings have been found in Christina Gulch, about two miles from Helena, from which one nugget weighing 14½ ounces was taken.

Many believe that the gold placers, of which Helena is the center, are the most extensive ever discovered. The immediate gulches—Last Chance and Dry—comprise but a very small portion. Almost every gulch, for sixteen or seventeen miles in the direction of Virginia City, contains paying ground; water—which will be at hand this year—is only needed to make them alive with mining enterprise.

New diggings have recently been discovered between Indian and Beaver creeks, about thirty miles from Helena. The diggings are said to be unusually shallow, and so rich that with the necessary water miners will realize their fifty dollars a day without any unusual exertion.

#### NEVADA.

##### Black Rock.

From the *Sage Brush* of Jan. 19th: Wm. Kingsbury has just arrived from the mines, and reports all the boys in good spirits. Prof. Robinson, the assayer, is taking out large chunks of bullion. The mill is all ready to run as soon as Mr. Evans arrives with the salt.

A small quantity of rock from the Emerald ledge, Chico Company, worked by Mr. Ward, shows immense results in gold and silver.

We were also shown by Mr. Ward, a small piece of High Rock ore, worked by the smelting process, which was literally covered with silver. We are fully of the opinion that there will be more bullion taken out in the Black Rock country next season, than in all the balance of Nevada.

##### Humboldt.

From the *Register* of Feb. 2d: Last week's *Register* spoke of the Oreana smelting works as temporarily suspended, while making improvements in the works. We are informed that no suspension has taken place. While rebuilding a furnace which has burnt out, the other furnaces are kept going.

The Utica Mill and Mining Company is progressing finely with the erection of mill and other works at the lower neck of Humboldt Lake. Teams are constantly hauling the material out.

##### Pahranagat.

From the *Reveille* of Jan. 23d: W. B. Cogswell came through in fifty-seven hours traveling time from Pahranagat to this city.

He informs us that tests of the best ore from the Illinois ledge, show it to be worth \$200 per ton. The district is more fully supplied with water than was at first supposed. A 10-stamp mill had arrived at El Dorado Cañon by the river, and was being hauled to Pahranagat by the way of Callville at twelve cents per pound. Dr. Congar has also a 5-stamp mill at the cañon, which will be hauled through shortly.

##### Reese River.

From the *Reveille* of Feb. 2d: The Manhattan mill is now working on North Star ore, and with great success. We saw the other day, some twenty-five tons of very rich selected ore in the company's storeroom. It is extremely friable, and crumbles on exposure to the air. Mr. T. F. Gould, the Consolidated Company, arrived from Hot Creek yesterday afternoon. He informs us that the first lot of bullion produced by their mill, amounting to some 2,000 ounces, is on the road to this city. Work on the mines in the district is confined at present to the Old Dominion, Keystone and Susquehanna. The ore from which the bullion was obtained was taken from the first named ledges, and was reduced without roasting. This mode of treatment is not advantageous, and he is now engaged in erecting furnaces for the mill of the company.

Two tons of ore from the Reveille district arrived yesterday. It is from the Augusta, Santa Fe and Crescent ledges. It is estimated to be worth from \$250 to \$500 per ton.

The Burning Moscow, in Cortez district, has just been developed at a thickness of sixteen feet. The ore is of fine quality.

From same of 5th: We recently visited the Florida, one of the Lander Hill "shoe strings," and brought away some very beautiful and valuable specimens. According to the calculations of Superintendent Sherman, the mine will yield \$15,000 during the present month, while the work of pushing down the incline will keep pace with stopping out the ore.

Same of 6th: Yesterday the Austin and Belmont Company's stage brought in five bars of bullion valued at \$4,766, from the mill of the Twin River Mining Company.

An assay made yesterday of pulp obtained from ore of the Reveille district gave a yield of \$143 of silver per ton. The ore was taken from the Mammoth Crescent ledge.

Same of 8th: The Mount Tenabo Company returns as the production of the Cortez Giant ledge for the last quarter of 1866, 450 tons, averaging \$61 per ton.

Some fine specimens of ore now in town, from the Phœnician ledge, Bunker Hill district, show an abundance of free gold.

In Hot Creek district, one company is developing three ledges on Keystone Hill, called Pilot Knob, Clipper and Alta. The ore from the Pilot Knob, tested at the Keystone mill, yielded at the rate of \$148.27 per ton; from the Alta, \$54.03.

Letter from Belmont to the *Territorial Enterprise* of Feb. 9th, has the following: In the Highbridge, the Combination Company have again struck the ledge at a distance of 230 feet from the mouth of the tunnel. The richness of the ore in this ledge is not a matter of speculation. The company took eight tons from the croppings where they have exposed the ledge; from this they assayed two tons of first class ore, and four more tons of second class, and sent it to Austin to be milled. The two tons yielded \$1,243, and the four tons \$657.

A postscript says: I have just seen a gentleman from the "Spanish Belt," where he has been prospecting for a lead located by some Mexicans, about eight miles westerly from here. He informs me that his company has struck ore of the very highest grade. He is confident that he can take out twenty tons per day, which will mill \$200 per ton, had he the means with which to employ men.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the *Territorial Enterprise* of Feb. 8th: Since the recent strike of water in the Colorado tunnel the air has been so bad that work in it could not be prosecuted, but an air tube has now been laid in the tunnel—which is 1,600 feet in length—and all difficulties in that respect obviated. Work is to be at once resumed.

The old Eclipse hoisting works at Gold Hill are being taken down and removed, on account of the caving of the foundations. When the removal is completed, we learn that it is the intention of the company to take out the surface ore for milling.

The east drift of the third level of the Kentuck mine, we are informed, day before yesterday, cut a vein of pay ore averaging seven feet in width, and of a character

which will doubtless pay well. The mine throughout looks excellently well.

Same of 9th: The sinking of the Bonner shaft of the Gould & Curry company is still being energetically prosecuted, about a foot a day being the progress made. Were it not for the great depth—750 feet—and the amount of water to be contended with, it would of course be sunk at a faster rate. No extensive bodies of good ore are found at the lower levels, but the upper portion of the mine and the surface workings still continue to yield goodly quantities of excellent pay ore. The Curtis shaft of the Savage company is now 535 feet deep, but the further sinking of it has ceased for the present, the machinery not being in working order. The big shaft of the Chollar-Potosi company is 700 feet deep, but not being sunk any deeper at present. The Ophir-Mexican shaft is 621 feet deep, and from near the bottom of it a tenth level is being opened to the Ophir mine.

Same of 10th: The Granite mill, at Upper Gold Hill, is again at work reducing ore. . . The Overman mine is still being actively worked. . . The south shaft of the Yellow Jacket is being sunk for a new level. . . At Gold Hill all the dumps are full of ore, and teams are again busily engaged in hauling to the mills. . . J. D. Andrews have collected several millions of tons of the tailings from the Comstock lode, which have heretofore been allowed to run to waste down Gold Cañon.

From the *Virginia Union* of February 4th: The Granite mill, one of the old Pioneers of Gold Hill, started up this morning and worked to a charm. This mill has ten stamps, with an adequate number of pans, settlers and agitators. The engine is of the Corliss pattern, 50-horse power, and runs the whole mill with ease with steam generated in a small-sized tubular boiler. It will reduce ore from the Confidence mine, which is situated directly west of the mill.

From the *Tribune* of Feb. 8th: The survey ordered in the Savage mine was proceeded with for two days. Admittance was then refused. An order restraining the U. S. Marshal from entering the mine is now being argued. Yesterday afternoon the Savage company ceased work, the fires in the furnaces were extinguished, the cages deposited mid-way in the shafts, and the entire machinery is being repaired, the reason being given that too large an amount of ore has accumulated at the dump. The whole affair excites a lively public interest, and a great many jokes grow out of the ease as it progresses. It is a vulgar belief on the streets that the Savage works will be in order for resumption of active operations about the time Judge Baldwin's Court adjourns.

Same of February 9th: The new shaft of the Hale & Norcross company has reached the depth of seventy-five feet. The dimensions are seventeen feet six inches long by seven feet six inches wide, divided into three compartments, with a pump shaft, and timbered in the Cornish "set" style with 12x15 stuff.

From the *Gold Hill News* of Feb. 5th: The amount of treasure shipped from the Imperial mine during the month of January was \$115,940. Although this has been the worst month for the hauling off ore, this is the largest shipment ever made in one month from this mine.

There is at this time, out and ready to be taken away, at the different mines in Gold Hill, not less than twenty thousand tons of ore. If the roads will but improve so that the teams can haul away the ore, there will be enough to run all the mills in the country steadily for the next six months before they can catch up. If the mines of Gold Hill do not look promising at the present time, then they never have done so.

#### NEW MEXICO.

A correspondent of the *Denver News*, writing from Taos, Jan. 11th, says: The prospects for mining around Taos are very good. We have now here two miners, returned from Montana this fall. Eugene Littlellier and Gabriel Parrot, who have been prospecting in the mountains, near Taos, and arroya Honda. They washed gold in several places, and got as high as ten cents to the pan. There is no doubt but our mines will pay rich. The only thing we need here is an industrious population. Messrs. Parrot and Littlellier washed only the dirt taken from the surface.

A DIFFERENCE OF ONLY TWENTY-FIVE THOUSAND YEARS.—The bones recently exhumed at Cohoes are already bones of contention. Professor Hall of the New York State Geological Museum, says they are the bones of a mastodon. Edward Maguire, of Saratoga, says they are those of a show elephant that died there about forty years ago. "Who shall decide when doctors disagree?"

## Canvassing Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting our Agents in their labors of canvassing, by lending their influence and encouraging favors. We shall send none but worthy men.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 26, 1866.

Mr. A. C. Knox, is our city soliciting and collecting Agent, and all subscriptions, or other favors extended to him, will be duly acknowledged at this office.

Mr. L. W. Felton, is an authorized agent for this paper at Portland, Oregon. Dec. 1, 1866.

Mr. S. D. Whitaker, is our authorized Traveling Agent and Solicitor from this date. Jan. 1, 1867.

## San Francisco:

Saturday Morning, Feb. 19, 1867

## Notices to Correspondents.

**ALPHA—FORCE IS DEFINITE IN QUANTITY AND INDESTRUCTIBLE.**—These points may be proved in various ways—a few of the most simple examples must suffice. For instance, a pound of charcoal, when burned with a free supply of air, combines with  $2\frac{1}{2}$  pounds of oxygen, and produces  $3\frac{1}{2}$  pounds of carbonic acid. The chemical action produced by this combustion is accompanied by the evolution of a definite amount of heat, which heat, if it is applied without loss, is sufficient to convert  $12\frac{1}{2}$  pounds of water at  $60^\circ$  into steam at  $212^\circ$  Fah.; consequently, when charcoal is burned, there must, necessarily, be brought into action a definite amount of power; only varying in the proportions, similar calculations may be made with other substances which are combustible in the atmosphere. The quantity of electricity associated with a given quantity of matter, is equally definite. If a piece of amalgamated zinc is placed in voltaic relation with a plate of platinum in dilute sulphuric acid, for each pound of zinc which is dissolved a quantity of electricity is liberated, by means of which a pound of metallic copper may be separated from the solution of a sufficient quantity of sulphate of copper, or 3-2.5 pounds of silver may be reduced from a solution of nitrate of silver. The heat developed by the combustion of charcoal may be employed to produce motion, and thus motion may be again employed to produce heat, as Joules' experiments establish the fact that the quantity of heat developed is exactly proportioned to the amount of motion employed for this purpose.

**MATTHIAS CORVINUS.**—The curious and very interesting machine you allude to, exists at Schemnitz, in Hungary, where a part of the machinery for working some of the mines consists of a perpendicular column of water, 260 feet high, which is made to press upon a quantity of air inclosed in a strong and tight reservoir. The air becomes greatly condensed by the superincumbent column of water, which is equal to the pressure of eight or nine atmospheres. When a pipe communicating with this reservoir of condensed air is suddenly opened, it rushes out with extreme velocity and instantly expands; by so doing it absorbs so much heat, that it freezes the moisture contained in the issuing and surrounding air, and temporarily forms a miniature snow-fall, which can be gathered on a hat held in the blast. The force of the issuing current is so great, that the workman who holds the hat is compelled to lean his back against a wall in order to retain his position. The principle, of which the above is a description of a practical example, has been recommended for the purpose of cooling the atmosphere of rooms in tropical climates, and even to form ice. For the latter purpose, however, the superior expansive power of ammoniacal gas appears more likely to come into general use.

**GEOLOGICAL SURVEY—MINING STATISTICS.**—A Washington telegram, dated Feb. 7th, says: "On motion of Conness, the Secretary of War was directed to have a geological survey made of the territory between the Rocky Mountains and Sierra Nevada, on the route of the Pacific Railroad. Also, on his motion, five thousand dollars was appropriated for the collection of statistics on the subject of mines and mining."

## Blasting by Electricity.

One of the most useful purposes to which electricity is applied, is that for blasting in mines and quarries, and for submarine operations of a similar character. This novel use of the electric spark, was first introduced into the mines by Martyn Roberts. The first to apply it to submarine operations was Major-General Pasly, who employed it for blowing up some sunken vessels in the Thames river. The General commenced his operations by the use of a long fuse, inclosed, in connection with the charge of powder, in a tin case. His friend, Mr. Palmer, suggested the use of electricity, to be conveyed by insulated wires. The General promptly adopted the suggestion, and it was first employed in removing the wreck of the Royal George. From that time electricity began to be generally used for such purposes.

The advantages of blasting by this agent are numerous and important; one of the chief of which is the increased effects derivable from a given amount of powder, from the fact that no pressure is removed by the vent formed through the tamping, by the burning of the safety fuse. Careful estimates have shown that at the instant of discharge there is a pressure exerted of 200 atmospheres. In the hundredth part of a second thereafter, and before the impact can be communicated to the rocks to be ruptured, there is a decrease in the pressure of fully twenty-five per cent. by the escape of gas through the hole left by the fuse. The excess of powder thus required, also calls for the drilling of holes proportionately larger, and of course at greatly increased expense.

Another advantage of electric blasting is dependent on the fact that the heat is not applied till the instant it is wanted, and then the explosion is instantaneous; whereas, in the employment of fuse, it frequently takes place after it is expected, and not unfrequently when the workman is imprudently approaching to learn the cause of delay, from which cause accidents are of frequent occurrence. Less powder is required for an electric blast, and less smoke is produced. Moreover, a series of blasts can be instantaneously fired by electricity, producing a much greater effect than a series of blasts with fuse, the explosions of which cannot possibly be made to act instantaneously.

As to the economy, safety and efficiency of blasting by electricity, there can be no possible doubt, when any considerable amount of it is to be done. Its employment in mines is especially desirable. For submarine work it is now considered indispensable. The process and manipulation required for this mode of blasting is easily acquired by any person of ordinary intelligence. Any person who can be safely trusted with the use of powder, ought to be able to comprehend all the requirements necessary for blasting by electricity. A perfect understanding of the use and care of a properly constructed battery, ought to be acquired by any person of ordinary intelligence in a few hours' practice. The method of charging the hole and connecting it with the battery, is the most delicate and intricate part of the work; yet, when once understood, it is extremely simple, and requires nothing but care and attention. There is an absolute immunity from danger, except in case of the most gross carelessness. The usual danger from tamping is of course always present, but it is in no way increased by inserting the electrical wire in the charge, which is made of copper, except the half inch or so for making the connection, for which a fine platinum wire is usually employed. So long as the two battery ends of the wire are disconnected with the battery, it is impossible for the electric spark to start on its mission.

Electricity is now quite generally employed, both in Europe and in the Eastern States, for heavy blasting operations, and wherever introduced it gives the fullest and most complete satisfaction. In our next we shall give a description of the kind of battery to be used, the *modus operandi*, etc.

## A Brilliant Meteor.

A meteor, or aerolite, of unusual brilliancy and size, was seen in the horizon to the northwest of this city, about a quarter past five P. M. on Monday last. It passed rapidly in a southeasterly direction, at a descending angle, until lost to view below the horizon. A few seconds after its disappearance, a dull heavy sound was heard in this city, like the report of a distant cannon.

The same meteor was seen at Petaluma, Haywards, Stockton, Gilroy, San Juan, Monterey, Santa Cruz and Nevada City. All accounts agree in the direction which it took, and to its general appearance. It described, as near as can be judged, the same track taken by the great meteor of July 12th, 1865. Both meteors occurred during daylight—the one on Monday last just before sunset, and the one in July, 1865, just after sunset, but before dark. Both were first seen at about the same point; that of 1865 was traced to the southern portion of Tulare Valley. The present one has thus far been traced only a short distance below San Juan; but when last seen, so far as heard from, was making its way direct for the southern portion of Tulare. We may yet hear of it there.

There must have been several explosions. The one heard in this city could not have been the same as that heard at San Juan, Monterey, etc. The sound reached this city within a few seconds after the meteor disappeared. The explosion heard from the south of San Juan, if it could have reached this city at all, could not have been heard here until fully seven minutes after the meteor had disappeared.

When an aerolite enters the earth's atmosphere, it leaves the inter-planetary space at a temperature, as an evening cotemporary remarks, from  $250^\circ$  to  $350^\circ$  below Fahrenheit's zero, but it does not condense, as the same paper remarks; it expands slightly by the heat suddenly generated from atmospheric friction, and this sudden expansion causes fragments to fly off. It is the sudden parting with these fragments which causes the detonations which accompany such phenomena.

The detonation heard here was most probably given off before the aerolite had moved a dozen miles south of this city, and while it was passing over the bay, into which some of its fragments doubtless fell. The loud report heard at San Juan, and vicinity, would indicate a very considerable fracture, perhaps sufficient to destroy its momentum and bring the entire mass to the earth in fragments. The mass of this meteor was undoubtedly quite large. It appeared to observers at Nevada City, at least 150 miles distant from its path, as large as a 24-pound cannon ball. It must have been very luminous to have been visible in the presence of the sun.

**THE MINING LAW.**—Messrs. Stewart and Conness, the Pacific Senators on the Mining Committee, do not deem it advisable, says a Washington letter of January 13th, to advocate further legislation on mining matters during the present session. They think the operation of the law passed at the last session should be fairly tested before the question is further discussed. We shall in our next issue publish the instructions recently sent by the Commissioner of the General Land Office to the local land offices.

**CONCENTRATORS.**—Parties interested in this class of mining machinery will find in the advertising department of this paper a new engraving, giving a sectional view of Hendy's latest improved machine, together with directions for working the same. We hear that this concentrator has been adopted at Grass Valley, and is meeting with success.

**RICH STRIKE.**—The Hope Gravel Company of Grass Valley, has struck a stratum of gravel between four and five feet thick, a pan of which was washed, and yielded fifty cents worth of gold.

## Reminiscences of Arizona.

The first mining district organized in Arizona Territory, by Americans, was called "Colorado." It is located on the west bank of the river of that name, 550 miles above its mouth. It is twenty miles square—the Colorado river forming its eastern boundary. For a distance of eleven and a half miles through the center of this district runs a deep and wide gorge, well known as "El Dorado Cañon."

## ITS DISCOVERY.

In 1861 a party of Californians, from Nevada county, set out to explore the then unknown regions, in the vicinity of Death Valley. About 100 miles southeast of that terrible valley, they came upon a series of mineral lodes, which were found to be galena and of a very high per cent. Some of them were found to assay as high as \$70 per ton in silver. This party organized a district, and named it Potosi; part of the rest went to work prospecting the lodes, while the rest of them started for supplies. They arrived in Los Angeles, made known their discoveries, and immediately returned with a new outfit, followed by a large number of adventurers. Soon after they arrived at the mines, an old Indian came into the district and informed the miners that in *three sleeps* he could take them to where there was plenty of gold. Five of the miners agreed to follow him, and after three days of hard travel over high mountains and through deep gorges to the southeast, they struck the head of what is now called El Dorado Cañon. Traveling down the cañon a short distance towards the Colorado river, the Indian led them up into some high rocks and showed them large masses of *bright sulphurets of iron*, which he supposed to be gold.

Upon looking around, they found they were in the heart of an immense mineral region. Silver and gold lodes of great width and very rich, could be found on every side of them, the most important of which they at once located. They also found very good copper ore, galena and iron; also beds of alum and a number of beautiful springs of water, at different points in the cañon.

In the Arizona Miner of June 27th, 1866, we find extracts taken from a letter written to the *Alta California* by Frank S. Alling, Postmaster at El Dorado Cañon, in which he says that up to 1865, there were recorded in that district 760 mineral lodes, and 850 mining deeds. El Dorado Cañon claims the honor of building the first quartz mill in Arizona Territory. There were some smelting works and arastras put up in Southern Arizona. Lieut. Mowrey undertook to get an engine and crushing machinery in 1852; but a part of the machinery only arrived. The boiler was left in the desert, where, for ought we know, it still remains, a mortal terror to the Indians, who supposed it to be a huge cannon.

Now, after a Rip Van Winkle sleep, rendered necessary by Indian hostilities, difficulties of communication, etc., this noted mining district is waking up. Government is helping the miners out in the way of protection from the Indians. A permanent fort is being built at the mouth of El Dorado Cañon, and is to be garrisoned by Co. D, 9th U. S. Infantry, Capt. Yard. This command arrived at the Cañon January 6th, 1867, with one year's supplies. This is the highest fort on the Colorado river, being sixty miles above Fort Mohave.

Now, as this rich district has protection from the Indians, we expect to see capitalists improve the opportunity, and develop some of these noted ledges. A mail runs through the cañon twice a week, from Slat Lake City, Los Angeles and Prescott.

On the 6th of January last, Capt. Rodgers arrived at El Dorado Cañon with the steamer Esmeralda, with supplies, and also two quartz mills for Pahrangat district, northwest of the cañon. This will be the steamboat landing for the above named mines, as there is a fine wagon road between the two points.

Steps are being taken in this city, to start the Colorado mill at the cañon at once; also two companies are organizing in New York to work mines in the Colorado district.

## Government Gas Lighting.

The unpopularity and stubborn inclination of gas companies everywhere, to combine and monopolize, has so aroused the public feeling in Europe, that the municipal governments in many of the cities are taking the subject of gas lighting into their own hands, with the view of furnishing this indispensable article of light to all, at the lowest nominal price. In the city of Prague, corporation gas is now furnished at \$1.75 per 1,000 feet. The private companies have been compelled to come down to the same figure or close up. It seems they can afford to go on, even at that low rate; although they have no hopes of effecting a "combination" with their new competitor.

Schemes are on foot before the English Parliament, looking to forcing a sale of the works of the various London companies to the metropolitan authorities, as a matter of public necessity, in order that light may be furnished at a cheap rate, and abuse and extortion in that direction put down.

Similar movements are also on foot in various directions, both in England and on the Continent. Gas is now furnished in Liverpool for *sixty-seven cents*, and a splendid article at that. In Plymouth, a poorer, but yet serviceable gas, is furnished as low as *sixty-one cents*. There are 157 chartered gas companies in England, and about 600 in this country.

The citizens of New York are beginning to look anxiously to the Legislature at Albany, for the means of securing cheap light for that city. The feeling is such that the gas companies will either have to give up their enormous profits, or lose the value of their property entirely. The public are calling for more light, and are determined to have it, and cheaper, too. It can and should be so furnished. If no other means can break down the combinations of capital, by which the poor are compelled to pay more than a fair equivalent for that which they must have, and yet which must come from associated capitalists, it is the duty of the proper authorities to see that public steps are taken to provide for the necessity. In this there need be no improper conflict between labor and capital, in the proper sense of that idea.

What say the citizens of San Francisco? There is no question but that we might and should have cheaper light in this city, and better than that now furnished. It appears that the experiment of a "Citizens' Company" is not the way to get it; capital is too powerful. Some other way must be devised.

## HYATT'S HAND-BOOK OF GRAPE CULTURE.

H. H. Bancroft & Co. have laid upon our table a copy of this work. It is a neat volume of some 275 pages. The author, T. Hart Hyatt, has spent several years abroad, in different countries, and has come to the conclusion that California presents more favorable prospects for the successful culture of the grape than any other part of the world. The book professes to be a complete manual, with instructions for the management of the grape and the manufacture of wine, and is especially designed for California. A very full list of the most esteemed varieties of European grapes is given. European and California wines are compared. Raisin making is urged as sure to be a profitable business in California, and some directions for it are given. The book contains a considerable amount of valuable information which is not generally found in such treatises.

A STEAM PLOW, which is capable of plowing an acre an hour, twelve inches deep, has recently been sent from England to this country. The price is \$10,000. An overseer is in charge. The Custom House has levied a duty on this sample of nearly \$4,000. Mr. Bidwell offered a joint resolution refunding this, which was immediately passed.

## HENDY'S LATEST IMPROVED CONCENTRATORS,

FIG. 1.

FIG. 2.

## FOR GOLD AND SILVER ORES,

With Revolving Stirrers and Rotary Distributor.

Can be seen in Operation at the Union Foundry, First St., San Francisco.

Fig. 1 is a sectional view. H is the support for upper end of shaft, marked B; L is the step; C, the hopper, in which the tailings are thrown; the tailings flow down the arm, K, then distribute at the Distributor, marked D. The tailings enter the pan, A, at its periphery, and the debris discharges near its center, and passes off in the spout, F. The sulphurets discharge at gate E; amalgam and quicksilver at plug I. S is a descending channel, for forcing the sulphurets, amalgam and quicksilver to their respective points of discharge; S is the sulphurets; M, the stirrers, with copper plate coated with mercury. The rotating of the stirrers prevents the sands from packing near the center of the pan, where the motion is diminishing. The pan, A, shows a curvilinear bottom, which gives a more precipitous descent near its center, for the purpose of forcing the sulphurets towards the periphery. It will be noticed that the centrifugal force and motion diminishes towards the center of the pan, for which reason the inclination is increased for the purpose above mentioned.

Upon the under side of the distributor are small openings or perforations, through which the pulp is dropped from the feeder into the pan.

The stirrers, marked M, and distributor, D, is made to sweep slowly around by means of the ratchet teeth upon the upper edge of the pan, in which two pawls are seen to work. This motion is obtained from the vibrating action of the pan. These parts can be so connected, as in Fig. 2, that two can be driven by one shaft and pulley.

The revolving stirrers and rotary distributor can be easily attached to Hendy's old Concentrators, and at a small expense.

These machines have been thoroughly tested, and pronounced a perfect success.

The proprietor of this Concentrator feels satisfied that it has no equal in use. It is designed for saving finely divided Quicksilver, Amalgam and Gold from the sands, and for concentrating and saving the Sulphurets, and is to be placed behind any and all other machines in use. Any person of ordinary experience with Quartz Mills can readily fit them up and run them.

The principle upon which HENDY'S PATENT CONCENTRATOR is constructed, is the only true and mechanical one for the purpose of concentration.

## CENTRIFUGAL FORCE AND GRAVITATION,

Combined as they are in this machine, CANNOT FAIL TO ACCOMPLISH the object sought.

Many certificates from proprietors of mills, who have this Concentrator in use, can be had, if required, giving the most flattering accounts of its efficiency.

A most substantial evidence of its worth is the fact that the proprietor is receiving repeated orders from those who are using them, and who have tested their merits.

Those in want of Concentrators would do well to visit some of the quartz mills that have Hendy's Patent Concentrators in use, and satisfy themselves before purchasing other Concentrators of pretended merit. THEY ARE WARRANTED TO WORK SATISFACTORILY.

## Directions for Operating Hendy's Concentrator.

The sulphurets are drawn off while the Concentrator is in motion, in the following manner:

FIRST—Set the Pan, A, level, by its inner rim.

SECOND—While in operation, keep the Pan, A, about half full of sulphurets. [See Figure 1, marked S.]

THIRD—Open the gate, E, sufficiently to discharge the sulphurets as they accumulate over the amount above mentioned.

FOURTH—The crank shaft to make 200 to 220 revolutions per minute.

## CAUTION.

All of HENDY'S PATENT CONCENTRATORS are marked thus:

"J. HENDY, Patented February 27th and April 17th, 1864."

Orders or letters of enquiry, address,

JOSHUA HENDY, Patentee,

Union or Fulton Foundry, San Francisco.

Feb. 1st, 1867.

TWENTY-TWO thousand eight hundred dollars worth of gold dust was purchased recently in a single day, by Block & Furth, San Juan, Nevada county.

## City Amusements.

METROPOLITAN.—At this theater the "Sheep's Foot" has been running during the week with good success. It will give place to "Raoul; or the Magic Star" next week. On Friday evening, a benefit of the Independent California Greasers.

OPERA HOUSE.—"The Long Strike" was played here for the first time on Monday night, Miss Kingsbury taking the part of the heroine, Jane Learoyd; Edwards that of Noah Learoyd, her father, and the leader of the strikers; McCullough as Jim Starkie, and Pardee as Riley the sailor. In this piece the effect of a strike, and its results to the strikers, are strongly portrayed, and many of the scenes are highly interesting. In that of the telegraph office, the messages are actually sent over the wire, as a practiced ear will readily detect. The character of Noah Learoyd is finely personated by Edwards, and Miss Kingsbury and McCullough, though their parts are of less interest are very good. The part of an impulsive Irish sailor is well taken by Pardee. Altogether the piece, though not highly sensational, possesses a strong interest, and is well worth seeing.

ACADEMY OF MUSIC.—On Wednesday evening, Miss Amy Stone made her debut in the "Pearl of Savoy." She was supported by H. F. Stone, Kate Denin, Mrs. Judah, Paucefort, Wilson, and others.

## A Paying Newspaper for Sale.

A one-half interest in one of the best Country Papers in the State, is offered for sale on desirable terms. The Journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the Mining and Scientific Press; or address DEWEY & VAUGHN, Mountain Messenger office, Downville, Sierra County, Cal. 7v141f

## SAN FRANCISCO

## UNION BUSINESS COLLEGE

Merchants' Insurance Building,

408 California Street.

THIS INSTITUTION IS DESIGNED TO PREPARE boys and men for business pursuits, and to impart a thorough commercial education. It is conducted upon actual business principles. The student, upon entering College, is furnished with a capital in cash and merchandise, rents a place of business, opens an account with the bank, insures his goods in the insurance office of the College, and enters upon the arena of business. He commences speculation, carrying out all the details of trade, buying and selling goods, depositing in and checking from the bank, making and negotiating notes, drafts, bills of exchange, and recording the transactions and keeping the books in a regular and scientific manner. From this he advances in other capacities, until he finally takes his position in the Union College Bank, a regularly established institution, complete in all its appointments, and having a circulation of one million in College currency. This course saves from four to six weeks' time in copying useless manuscripts. There is no vacation, and students can enter upon any business during the year. The public are invited to call and examine the various departments. Sessions day and evening. Address 7v11 JAMES VINSONHALER, Principal.

## A. S. Hallidie &amp; Co.,

MANUFACTURERS OF

## FLAT &amp; ROUND WIRE ROPE,

For Mining, Shipping, Ferry,

AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hemp Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to any of whom we refer those interested as to the great advantages over any other kind of rope; selecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure to have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—very strong and durable—one third the weight of hemp of equal strength, saving in freight for remote localities. Suitable sheaves and blocks turn and when required.

Galvanized or Ungalvanized Round Wire Rope—for Ships' Rigging, Derrick guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—for wide streams. Ferry Sloops supplied.

Iron and Copper Wire Cord— $\frac{1}{2}$  to  $\frac{1}{4}$ -inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.
Cir. 100 ft. conf.	Cir. 100 ft. conf.	Cir. 100 ft. conf.	Link 100 ft. Link.	Bk'g Wt. per Sq. in. Load.

Pamphlets containing data, with prices annexed, forwarded free, by mail or express, on application to manufacturers. 25v13-6m9p

## J. S. PHILLIPS, O. E. M.,

Mining Engineer of Cornwall,

WHO CAME TO WORK LEDGES FOR A NEW YORK Company, at Humboldt, Nevada, is free for examination or Superintendence of Mineral Properties, in consequence of his condemnation and immediate abandonment of those operations.

Reference—B. W. Mueser, 528 Clay street, San Francisco, Humboldt City, Nevada. 6v141f

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Bag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.**—Locomotive, Flat, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's improved Tractor Curved Pan, Zenos Wheeler's improved flat bottom pan, Beldin's pan, Ventch's tubs, Prater's concentrators, Waklee's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills. Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of Iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH.

24-12

IRVING M. SCOTT  
H. J. BOOTH & CO.

## Machinists and Foundries.

**PALMER, KNOX & CO.,**  
**Golden State Iron Works,**  
Nos. 19, 21, 23 and 25 First Street,  
SAN FRANCISCO.

MANUFACTURE ALL KINDS OF  
**MACHINERY,**  
**STEAM ENGINES AND QUARTZ MILLS**  
DUNBAR'S IMPROVED  
**Self-Adjusting Piston Packing.**

Requires no springs or screws; is always steam tight; without excessive friction, and never gets slack or leaky.

**WHEELER & RANDALL'S**  
**NEW GRINDER AND AMALGAMATOR**  
HEPBURN & PETERSON'S

**AMALGAMATOR AND SEPARATOR,**  
**Tyler's Improved Water Wheel,**  
Giving the greatest power, at lower cost, than any Wheel in use. There are over 1,500 running, giving universal satisfaction.

**KNOX'S AMALGAMATORS,**  
WITH PALMER'S PATENT STEAM CHEST,  
Superior for working either Gold or Silver Ores.  
**Geoline White Iron Stamp Shoes and Dies**

Having been engaged for the past eight years in quartz mining, and being conversant with all the improvements, either in Mining or Milling, we are prepared to furnish, at the shortest notice, the most perfect machinery for reducing ores, or saving either gold or silver. 13v10ay-tr

**WILLAMETTE IRON WORKS,**  
**PORTLAND, OREGON.**

**Steam Engines, Boilers,**  
**SAW AND CRIST MILLS,**  
MINING MACHINERY, WROUGHT IRON SHUTTER WORK, AND BLACKSMITHING IN GENERAL.

Corner North-Front and E streets,  
18v13 ly One block north of Couch's Wharf.

**UNION IRON WORKS,**  
**Sacramento.**

**WILLIAMS, ROOT & NELSON,**  
MANUFACTURERS OF

**STEAM ENGINES, BOILERS,**  
And all kinds of Mining Machinery.

Also, Hay and Wine Presses made and repaired with neatness, durability and dispatch.

**Dunbar's Patent Self-Adjusting Steam Piston Packing,** for new and old cylinders, manufactured to order.

Front Street, between N and O streets,  
14v11 SACRAMENTO CITY

**JOHN WRIGHT,**  
**Pick Manufacturer,**  
No. 229 Fremont street, between Howard and Folsom,  
SAN FRANCISCO.

Has always on hand a general assortment of PICKS for Quartz and Surface Mining. Particular attention is called to his RAISED EYE QUARTZ PICK, which is especially adapted to Quartz Mining, and guaranteed to give good satisfaction. 13v13-y

**GEORGE T. PRACY,**  
**MACHINE WORKS,**  
Nos 109 and 111 Mission street, between Main and Spear,  
SAN FRANCISCO.

**STEAM ENGINE, FLOUR AND SAW MILL**  
And Quartz Machinery, Printing Presses,  
—AND—  
MACHINERY OF EVERY DESCRIPTION MADE AND REPAIRED.  
Special attention paid to Repairing. — 24-12

T. G. DURNING.

Stills, Wrought Iron

Worms, etc., etc.

Manufactured to Order.

Old Boilers Repaired

D. CAMERON.

6v12-ly

**NOVELTIES IN STEAMBOATING.**—A New York engineer has planned and is about building a river steamer, to be constructed entirely of Bessemer steel, the length to be 450 feet, the breadth 45 feet, and the displacement 1,760 tons. By constructing the steamer upon a peculiar model which he has planned, the engineer claims that with engines of 1,000 horse power he can secure a speed of at least thirty miles an hour. The boat will accommodate one thousand passengers, and is to run, if successfully built, between New York and Albany, making the trip in five hours.

Another New York engineer has prepared the plan and drawings for a boat to be propelled by the steam jet, on a modified plan of the English invention. It is proposed to construct a first-class boat, of large dimensions, for the Hudson river. The projector expects to attain a speed of from 25 to 30 miles an hour. Improvements and novelties in steamboat building seem to increase rather than diminish.

**EFFECT OF SEWING MACHINE LABOR UPON HEALTH.**—The London *Lancet* says that many women employed in the heavy manufacturing works with sewing machines, requiring the alternate motion of two treadles worked with considerable effort, had been obliged, owing to the serious effect produced upon their health, to abandon the trade entirely. The writer of the article does not consider that the same objection applies to the smaller machines in family use.

**TOWNE & BACON,**  
**Book and Job Printers,**  
Have the Largest Office,  
Do the most work,  
And do it better  
Than other offices

of Mr. LOCHHEAD, who has been in the business in San Francisco for the last fourteen years, and enjoys the reputation of having built ONE HUNDRED AND SEVENTEEN STEAM ENGINES.  
Screw Propellers of all kinds, and Steam Boat Machinery generally, made to order, and warranted to give perfect satisfaction in every particular. 25v12-3m

## Mechanical Drawings.

Persons wishing Mechanical Drawings can obtain the services of competent draughtsmen, by applying to this office.

**BLACK ROCK ORES.**—The *Susanville Sage* has the following:

A large portion of the rock is open, cellular and porous, and in most cases these cells or porosities are filled with metallic salts, entirely differing from the material composing the rock, indicating that these cells have been filled by sublimation or infiltration, by some metallic substance posterior to their cellular formation. We think that all admit that these are chlorides. But to contend that a chloride is a complication and hard to work, is to contend against reason and truth. If chloridizing ores complicates them, why do they, at Freiberg, follow the process, after so many years of practical experience; on this process depends their great success. Nature has done this for us; let us apply the labor of time to advantage as directed by judgment and common sense, and all will be right.

Two tests of these ores made this week by Ward & Bowman, have been extremely satisfactory. Some half dozen tests by amalgamation from the Snow Storm, Summit Series and Ruby have given results from one to twelve hundred dollars per ton in silver and gold. Mr. Ward has his pocket full of buttons, the result of these tests.

**MINING SUPERINTENDENTS.**—The New York *Journal of Mining* recently received a call from a gentleman, who stated that he was going out to take charge of a mine in the State of Nevada. The editor very naturally asked, "What mine have you ever worked or superintended?" He answered: "None—I'm quite new in the business." "That he will do his best," adds the editor, "is very likely, but we do not believe in setting men to do work concerning which they absolutely know nothing, and therefore advise the gentleman, for the sake of his one-tenth interest, not to go."

**HORSE RAILROADS.**—The city of New York supports eleven horse railroads, with what is equivalent to 170 miles of single track. The gross earnings of ten of these companies, for the year ending September last, was \$4,000,000, the net profit on which was \$800,000. The capital invested is \$16,000,000.

The chief mechanic in the Imperial Turkish midst, is an American, who has been employed there for thirty years past.

**To Owners of Copper Mines and Smelting Works.**

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 5v14f

**Remarkable Cure of J. Calwell,**  
Who had all the symptoms of being in the last stage of consumption, by the use of ALLEN'S LUNG BALM.

DEAR Sir, Hamilton County, Ohio, April 6, 1865.—Messrs. HARRIS & Co., Gentlemen—As I have reason to believe that Allen's Lung Balm has been the means of restoring my health, I feel that the afflicted ought to know what it is doing. I was first attacked with a violent cough, attended with cold night sweats. My feet and limbs swelled. The above symptoms continued for months, until I became confined to my bed, and reduced almost to a skeleton. My physicians and friends considered my case as entirely hopeless; but I could not live. I felt compelled to commence to use Allen's Lung Balm, which was strongly recommended to me for the cure of consumption. To the astonishment of all, I began to recover almost immediately, and in less than three months' time I gained sixty pounds. I owe all to the use of Allen's Lung Balm. I now enjoy good health. Respectfully yours, JAMES CALWELL.

Sold by all Medicine dealers every where. 4v14-1m

**B. F. HOWLAND, PHOTOGRAPHER,**  
Nos. 25 and 27 Third street, east side, near Market street, San Francisco.

Enamelled Cards, Ambrotypes and Sun Pearls, executed in a superior manner. Small pictures copied and enlarged to any size, at one-half the price usually paid for such work. **Attention! Attention! Attention!**

**Look to Your Health in Time!**

**HEALY'S RHEUMATIC LINIMENT, FOR THE SURE** and speedy extermination of Pain, having no equal in the world, is now being universally used by all classes throughout the Pacific Coast. The Miner, the Mechanic, the Artisan, the Laborer, the Farmer, and the Merchant, pronounce it the Greatest Remedy of the age. Are you afflicted with Rheumatism? Use Healy's Rheumatic Liniment! Have you the Headache? Use Healy's Rheumatic Liniment! Have you a Sore Throat? Use Healy's Rheumatic Liniment! Have you the Toothache? Use Healy's Rheumatic Liniment! Are you subject to Cramps? Use Healy's Rheumatic Liniment! And for the cure of Cuts, Burns, Sprains, and the bites of poisonous insects, it has no equal in the world. A sure and permanent cure guaranteed in every case. Full directions on every bottle. None genuine unless H. K. L. is stamped on the cork and the face of the bottle. HEALY'S signature on the outside wrapper of the bottle. Wholesale Agents—Crane & Brigham, and R. H. McDonald & Co., San Francisco; and at retail by all respectable Drug gists and Grocers. Price, \$1. 2v14-1m

## THE PACIFIC IRON WORKS.

First & Fremont Sts., between Mission & Howard, San Francisco.

The proprietors of the above Works invite the attention of all parties interested to their greatly improved and unequalled facilities for manufacturing Steam Engines and Boilers, both Marine and Stationary, of any required size and pattern, Quartz Mills, Amalgamating, Pumping and Hoisting Machinery of the most approved construction. Flour, Saw, and Sugar Mills, Water Wheels, &c., &c. Our pattern list is most complete and extensive, embracing the late improvements in all classes of machinery adapted to use on this coast. We would call especial attention to the fact that we have secured the exclusive right of manufacture for the Pacific Coast of the celebrated Greeno Engine, conceded to be the most economical and perfect working Engine now in use. We are also exclusive manufacturers of the celebrated

Bryan Battery, Varney's Amalgamators and Separators, Ryerson's Superheated Steam Amalgamators and Rotary Crushers, Stone Breakers, &c. Orders respectfully solicited.

GODDARD & COMPANY.

Arm—having a range and accuracy equal to a rifle, and a most perfect Carriage. All the new models for sale very low. 12v13f

ALBERT E. CRANE.

**Economy in Advertising.**—The Mining and Scientific Press is the best and most economical mining advertising medium in this city. Our terms are less than one-half the rates now charged by daily newspapers, and the mining community are beginning to appreciate our reasonable rates of advertising. The Press contains, proportionally, a larger amount of mining advertising than any other paper on the Pacific coast. Its character renders it the proper journal for the concentration of mining patronage.

SHAW, San Francisco, care Mining and Scientific Press. 11v13-1m

## CONNECTICUT

Mutual Life Insurance Co.

The Largest Life Insurance Company in the World.

ASSETS.....\$12,000,000.

## THE CONNECTICUT MUTUAL

IS NOW THE LARGEST AND MOST PROMINENT LIFE Insurance Company in the world, and it has

The Largest Number of Members,  
The Largest Amount Insured,  
The Largest Surplus,  
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT. of the premiums paid during the year ending 31st of January, 1863.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies to which Life Insurance is applicable, among which forms are—

**Whole Life Policies,** by a continued annual life premium.

**Whole Life Policies,** by TEN annual premiums.

**Endowment Policies,** by a continued annual premium.

**Endowment Policies,** by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

**Endowment Policies,** made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends on Annual Premium Life, and Continued Premium Endowment Policies, will, if the past success of the Company is continued, reduce their premiums ONE HALF. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be applied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

## DIRECTORS:

JAMES GOODWIN, HENRY C. ROBINSON,  
GEORGE S. GILMAN, GUY R. PHELPS,  
MARCUS F. HOLMES, E. D. HILFANY,  
New York, CHARLES F. THAYER, Boston,

F. B. WATKINSON, THOMAS SISSON.

GUY R. PHELPS, President.

Z. PRESTON, Vice-President.

W. S. OLMSTEAD, Secretary.

O. W. POWERS, Actuary.

A. D. SMITH & CO.,

General Agents Pacific Coast,

Office, N. W. corner Montgomery and Sacramento streets, San Francisco. 17v13 p12

## Accidental Insurance!

The Accidental Insurance Company OF NEW YORK,

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, the insured receives a weekly compensation as long as he is disabled (not to exceed twenty-six weeks).

## ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.

\$10 will buy Policy for \$2,000, with weekly compensation of \$10.

\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

## SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month,	2-10.	4 months,	5-10.
2 "	3-10.	5 "	6-10.
3 "	4-10.	6 "	7-10.

## GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$8,000, and \$25 per week compensation, against Accidents of every description, Traveling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance" in which the assured may at the time be traveling, but they are GENERAL ACCIDENT TICKETS.

## SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with W. BARNES, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

## INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend it in its workings.

No MEDICAL EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

For Policies or further information, apply to

A. D. SMITH & CO.,

General Agents for the Pacific Coast.

Office, N. W. corner Montgomery and Sacramento streets San Francisco. 17v13

**Camargo Gold and Silver Mining Company, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of February, 1887, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately. In United States currency, to the Secretary, 402 Front Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.  
Office, 402 Front Street, San Francisco. feb16

**Jalla Gold and Silver Mining Company, Storey County, State of Nevada.**

Notice—There are delinquent, upon the following described stock on account of assessment levied on the tenth day of January, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.

And in accordance with law, and an order of the Board of Trustees, made on the eleventh day of January, 1887, so many shares of each parcel of said stock as may be necessary will be sold at public auction, at the salesrooms of Maurice Gore & Co., No. 327 Montgomery Street, San Francisco, Cal., on Friday, the fifteenth day of March, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

GEO. W. KINNEY, Secretary.  
Office, No. 418 California Street, Room No. 6, third floor, San Francisco. feb12

**Salamander Gold and Silver Mining Company, Location of Works: Leon's Ranch District, Calaveras County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the eleventh day of February, 1887, an assessment (No. 7) of fifty cents per share was levied upon the assessable capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, E. J. FEIFFER, at the Office, No. 210 Post Street, San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the fifteenth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Wednesday, the tenth day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

E. J. FEIFFER, Secretary.  
Office, No. 210 Post Street, San Francisco, Cal. feb16

**Whitatch Gold and Silver Mining Company, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of February, 1887, an assessment of fifteen (\$15) dollars per share was levied upon the capital stock of said Company, payable immediately. In United States currency, to the Secretary, 402 Front Street, San Francisco, Cal.

N. C. FASSETT, Secretary.  
Office, 402 Front Street, San Francisco. feb16

**Young Harmon Gold and Silver Mining Company, El Dorado County, State of California.**

Notice is hereby given, that at a meeting of the Board of Trustees of the Young Harmon Gold and Silver Mining Company, held on the fourteenth day of February, 1887, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately, in gold and silver coin of the United States, to the Treasurer, G. S. ARMSTRONG, No. 313 Dupont Street, City of San Francisco, Cal.

Any stock upon which said assessment shall remain unpaid on the twenty-third day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the eighth day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

G. S. ARMSTRONG, Secretary.  
Office, 313 Montgomery Street, San Francisco. feb16

**Blac Ledge Gold and Silver Quartz Mining Company, Kelsey District, El Dorado County, California.**

Notice is hereby given, that at a meeting of the stockholders of the above named Company, will be held on the twenty-third day of February, 1887, at 10 o'clock P. M. of that day, for the purpose of altering the By-Laws of the Company, and transacting such other business as may come before said meeting.

## Machinery.

# STEWART'S CELEBRATED HINGED Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. E is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years of experience in mechanical operations, and may be addressed at San Francisco, or called on at the Miners' Foundry, First Street, where his Pan is manufactured, and is to be seen at any time in operation.

## V. CUSHING, Agent

—FOR THE—

Purchase & Shipping of Machinery  
OF ALL KINDS.

Special attention given to Quartz Mill Machinery and Findings, and Miners' Material of every description.

Being a PRACTICAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city.

Refer, by permission, to—

Governor F. F. Low, San Francisco; C. T. Naylor, Stockton; Geo. Underhill & Co., San Francisco; J. W. Stowe, Russell & Erwin, Manufacturing Company, Odessa, No. 120 Front Street, San Francisco.

4v12

## HUNTER'S IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety per cent. of the sulphurets contained in the ore. The sulphurets, if desired for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ores will do well to have their sulphurets saved, as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

One of these Machines can be seen in operation at the UNION FOUNDRY, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

## VARNEY'S PATENT AMALGAMATOR.

These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Sellers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,  
San Francisco.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

BRODIE'S PATENT IMPROVED QUARTZ CRUSHER. The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertiser is enabled to offer these machines to the public at the following low terms:

No. 1.—Or 10-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2.—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....\$850  
No. 3.—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the link or radius bar, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening. F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First Street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne County:

RAWHIDE RANCH, Tuolumne Co., Sept. 25, 1866.  
JAMES BRODIE, Esq., San Francisco—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations; and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
R. P. JOHNSON, Supt. Rawhide Ranch Quartz Mill.

BRODIE'S PATENT IMPROVED CERNAN AMALGAMATING BARREL.—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.

Those infringing the patent rights to the above improved Barrel, are hereby informed that, and after the last November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.  
A drawing and full description of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.

A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 22d, 1866.

BRODIE &amp; RADCLIFFE,

Express Building, 402 Montgomery Street, San Francisco.

## PATENT HYDRAULIC HOSE SEWING

By S. HOWARD,

No. 326 DAVIS STREET, San Francisco.

22v13-3m

## STRONG & CO'S CELEBRATED UNION PAN!

A fast Grinder and thorough Amalgamator; has double Millers, Rolling Shoes and reverse action.

Millmen and others are respectfully invited to examine the Pan, before purchasing others, as it gives the best satisfaction. Can be seen in operation daily, at the San Francisco Foundry, Fremont Street, near Mission.

Ores, in lots not exceeding 2,000 pounds, tested by  
22v13 G. W. STRONG, Assayer.

## LEFFEL'S American Double Turbine

THESE WHEELS, UNEQUALED AND UNRIVALED IN the United States or the world, have been fully tested on this coast more than forty being in use at this date in California and Oregon, driving all kinds of machinery, Saw Mills, Flour Mills, Quartz Mills, etc., etc., etc.

CALIFORNIA REFERENCES.—L. Stockett, Folsom; O. Simmons, Oakland, (Mill at Clear Lake); Morgan Coville, Lexington, Santa Clara County; J. Y. McMillan, Lexington Santa Clara County. Send for Circular to

KNAPP & GIANT,  
Agents for California.  
26v13-1yq 310 Washington Street, San Francisco

## Hunt's California Pump

Has all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years.

Good judges have examined and pronounced them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 23 Second Street and 110 Jessie Street.

Also, Tread Horse Powers, Pumping Frames for Irrigating, Saw Frames, Sweep Horse Powers and Frames, all in one frame, the horse to travel around the frame.

For further particulars, send for Circular.

E. O. HUNT,  
21v13tf 28 Second and 110 Jessie Streets, San Francisco.

PRICES OF HUNT'S CALIFORNIA PUMPS.

No. 3.—3-inch cylinder, 6-inch stroke.....\$30 00  
No. 4.—4-inch cylinder, 6-inch stroke.....35 00  
No. 5.—5-inch cylinder, 6-inch stroke.....40 00  
No. 6.—6-inch cylinder, 8-inch stroke.....50 00  
No. 7.—8-inch cylinder, 12-inch stroke.....90 00  
A liberal discount made to the Trade.  
For further particulars, send for Circular.  
E. O. HUNT,  
21v13tf 28 Second and 110 Jessie Streets, San Francisco.

## BRUCKNER'S Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1866.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,  
19v12 416 Market Street, San Francisco.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont Street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc., etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

19v13-3m JAMES HITCHENS.

## Notice to Miners, Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

M. PRAG,  
8v13-1y Stove Store, No. 125 Clay Street, below Davis.

SUBSCRIBERS who do not receive the Mining and Scientific Press in due time, are requested to inform the publishers

A TOWN WITH A PROMISING FUTURE. Belmont is now the county seat of Nye county, Nevada. It is eighty miles south of Austin. The Reveille thus speaks of its surroundings:

The ravine on which Belmont is situated is the proper head of Ralston's valley. The mining district bears the name of Philadelphia, although more generally known as Silver Bend. The ledges which have given it celebrity are the Highbridge, Transylvania, El Dorado, Wide West, Silver Cord, Silver Champion, and their extensions, with perhaps some others not so well known. A mill is in operation, which, although very incomplete and wasteful in its working, produces about \$20,000 per month. From the size of the ledges, their evident richness, and the facilities for mining and reduction, there appears no limit to the amount that may be produced. Ascending the high mountain in the west, the eye can take in a silver-bearing country, that we may venture to say has not its equal upon earth in the multiplicity of its ledges or their individual wealth. In the range are the districts of Silver Bend, Great Basin, Manhattan, Santa Clara and Northumberland; to the west is the Tolyabe and the district of Twin river, where one mill is pouring out its treasure of forty or fifty thousand monthly, while over the summit are the districts of Washington and Marysville in the same county; to the south is seen the lone and singular mountain of San Antonio; to the east are the districts of Danville, Hot Creek, Empire, Morey, Reveille and Palhranagat, all of which, east, west, north and south, claim to be incomparable.

NEW YORK STOCK BOARDS.—There are four distinct Stock Boards in this city—the Stock Exchange, the Open Board, the Gold Board and Mining Board. The business of the last is rapidly increasing, the sales amounting to many thousands of shares per day. Most of the mines are located in Colorado, where New York invested many millions of dollars in 1863-4. Those which are most actively dealt in are the survivors of the hundreds then so promising. A mining company here has rarely less than 40,000 shares, and yet woe to the bear who sells too many short. The holders organize a corner in a twinkling, and pounce upon the wretch for all he's worth. The prices of the shares, however, rarely range above five or ten dollars. There is a lively feeling in mining stocks at present, the sales yesterday exceeding 20,000 shares. Before they were aware of it the bears had sold 30,000 shares of one company "short," and "they are catching it." You do nothing of that sort in California, of course.—Cor. Bulletin.

A GOOD SUGGESTION.—We clip the following from one of a series of articles on mining, which is being published by the Owyhee Avalanche:

It is always possible to so regulate the draught in a mine that a uniform temperature shall exist. Not so, however, in regard to water. But where a mine is very wet, so that the workmen are obliged to work with their clothing saturated with water, it is the duty of the employer to provide what is called a changing house—a room at the mouth of the mine—which should be kept warm, where the workman may change his wet clothes for dry ones before exposing himself to a change of temperature. By thus taking care of the health, and at all times condescending to the comfort of the workmen, he will enable them to perform a regular task, which will enable him to calculate with some degree of certainty the amount of work he can accomplish in a given time.

MONTE DIABLO COAL.—The Stockton Independent says:

The product of these coal mines is constantly increasing in public favor, and is much more sought after now than it was a year or two ago, for steam engines and for household uses. It contains too great a quantity of sulphur to be extensively used in the working of iron in forges; but as the workmen descend in the mine, the probabilities are that the article will become more solid, compact and free from volatile gases. The coal found at Corral Hollow is undoubtedly on the same range with that of Monte Diablo, but is lighter in quality, or not so much mineralized.

MINING IN INDIA.—An English company with large capital are opening coal and iron mines in the Nerbudda Valley, India. The Great India Peninsula Railroad company is building a branch road to the mines, and have a contract by which they will get the coal necessary for their engines at about one-third the cost of the imported article.

**FOSSILS IN DACOTAH.**—Dr. Hayden and two other gentlemen of the Philadelphia Academy of Natural Sciences, have collected a number of very interesting fossils in Dacotah, for the Smithsonian Institution. The remains of fresh water turtles point to the fact that the spot was once a lake shore; while later remains of an extinct species of camel attest that after the lake had ceased to exist, a burning sand plain took its place. Next come abundant specimens of an extinct species of ruminating animals, showing that these sand plains were afterwards covered with grass. Next, carnivorous animals who probably fed upon the aforesaid ruminants. No trace of man is found.

**"COURSE OF MINERAL VEINS."**—An article under the above heading has lately been published in several of our exchanges, and credited to the New York Mining Index. It appeared in the Grass Valley Union of yesterday. The article first appeared in the Reese River Reveille, some months ago, was written by Myron Angel, the editor of that paper, and was stolen, word for word, by the Mining Index, and published as an editorial. —Nevada Gazette, Feb. 6th.

Some other Eastern journals are "on it" as well as the Index. We would help pass 'em round, only we feel a little delicate about it. —[Eds. Press.]

A NEW MINERAL has been discovered by Wohler in the fine-grained platinum ore from Borneo, to which he has given the name *aurite*. It is a sulphide of ruthenium and osmium, consisting of small grains of iron-black color of high luster, harder than quartz. Its analysis gave ruthenium 65.18, osmium 3.03, sulphur 31.79. This is the first sulphide found in the group of platina metals.

**A STRONG-MINDED WOMAN.**—The Mrs. Burdell-Cunningham, who made so much noise a few years ago, has got a silver mine all to herself in Lower California. It is in Loretto, about one hundred miles north of Cape St. Lucas. She is her own superintendent, amalgamator, caterer and treasurer.

An article, supposed to be petrified bacon, was found a short time since on Carson River. It is "hard enough to drive a nail with."

## Gaston's Screw Grinder and Amalgamator

—IS—  
The Best Yet Invented.

For rapidity and thoroughness of work, the machine above illustrated is unequalled by any. It wastes no appreciable quantity of quicksilver, and is of itself a perfect *sculler*. Fig. 1 represents the pan with part of its side removed, and fig. 2 the screw miller, and its shoes. The letters c show the threads of the screw; H, its shoes, and D a low cylinder within which the screw rotates; E, represents open spaces through the base of the cylinder, and F, inclined partitions filling (at those points) the spaces between the cylinder and the shell of the pan. These inclined partitions are to intercept the current of pulp around the pan, as it issues from under the miller, and turn it toward the center again, over the screw. The dies are not shown in the figure—there are eight. Mercury is not ground, nor floured in this pan. The pulp is ground to a slum, with great rapidity; the miller is raised a little and the quicksilver is poured in *en masse*, forming a layer upon the bottom of the pan. The revolution of the screw then forces the pulp down into contact with the quicksilver, into which it is *effectually rubbed* by the shoes, while the screw, being constantly fed by the pulp from above, presses all under the miller outward—still in contact with the quicksilver, through the spaces, E, and thence over toward the center of the pan, when it is again seized by the screw and forced down into the quicksilver, rubbed into and forced off in contact with it, which process is continued as long as desired. The pulp can thus be forced into contact with the mercury at the rate of 1,000 pounds in three minutes, or twenty times per hour, and none can escape contact with the mercury, that contact being under the immense pressure of the perpetual screw, in addition to that of gravity, which (gravity) is the only available force in the other pans for bringing the pulp into contact with the quicksilver. "A word to the wise is sufficient." The Screw Amalgamator is the cheapest and most efficient pan manufactured. Millmen! call and see one running at the Pacific Foundry. For particulars, address the inventor, H. A. GASTON, at Cosmopolitan Hotel, San Francisco; or R. L. THOMAS, Esq., Virginia City, Nevada. 1v14qr

**Still Another Witness!**

LATHROP, Cal., Sept. 19, 1865.  
(White Oak Township, El Dorado Co.)  
This is to certify, that I have, for over thirty-six years, been afflicted with Chronic and Inflammatory Rheumatism, and the sufferings and tortures I endured in consequence cannot be told. I have, at an expense of thousands of dollars, employed many physicians, both in this country and in Europe (where I was born and resided many years), among which were several eminent professors of medicine, and I experienced no benefit from their treatment, more than at times a slight and temporary relief.  
About two years ago I was induced by some persons who had been cured by it to use Richard's Remedy for Rheumatism. It is enough to say that I was almost immediately relieved, and that I have not suffered with it since. I keep the medicine on hand, and, on the first approach of any returning symptoms, I take a few doses, which invariably puts it to flight. I therefore cordially recommend it to be afflicted as an untailing remedy for Rheumatism.  
**FREDR. FABER.**

**SAMUEL HILL,**  
General Agent, 111 Montgomery street, San Francisco.  
17v13

A CURIOSITY.—Mr. W. A. Holcomb, of this city, has shown us a copy of the *Independent Chronicle and Universal Advertiser*, printed in Boston, Mass., on Thursday, April 19th, 1792. It is Vol. XXIV No. 1225. Thomas Adams, Court street, is the publisher. Although somewhat mutilated, this is a most interesting and valuable relic. The matters of daily interest to our great-grandfathers are brought more distinctly home to our conception by the perusal of a document of this kind, than they could possibly be by any other means. Here we have an advertisement for a runaway apprentice, for whom a reward of eight pence is offered, by John Bent, jun. Again: "Elkanah Hawks, Respectfully acquaints the inhabitants of this Town that he continues his school for Misses, whom he receives at Hours suitable to their Convenience." Underneath the head of "Topographical Department," is an essay entitled "Thoughts relative to Navigable Canals," in which the writer gives elaborate directions for the construction of locks, etc., probably never dreamed that canals would ever be superseded as a means of transporting freight. The laws of the Commonwealth of Massachusetts, being published in this sheet "By Authority," we find in this number several Acts signed by John Hancock, as Governor, and John Avery as Secretary. The old-fashioned type and the coarse, dingy paper, remind us of the fact that they happen to be, just now, again in fashion. To our own notion, they seem absurdly out of place, unless associated with that peculiar quaintness of phraseology which was common at the time they were in use. However, we will only say, "*De gustibus non disputandum est.*" If people who have succeeded in making a beautiful white paper after years of tribulation, will tint it so as to make it look smoky, why let 'em, that's all!

PROFITS OF PATENTS.—A sewing machine, which costs the manufacturer but twenty dollars, sells for one hundred dollars; mowing machines, which cost thirty dollars, sell for one hundred and forty dollars. A small machine for sawing wood, recently invented, and which costs but eight dollars to construct, is being sold for thirty dollars. India-rubber goods, and many fancy articles, sell for a much greater advance on the price of manufacture.

THORNBURG vs. THE SAVAGE CO.—A Carson City telegram, dated February 12th, says that Judge Baldwin, in the U. S. District Court, had that day granted an injunction in this case, and also stated, that if, upon examination of the law, he found it conferred sufficient authority, he should fine the Company twenty thousand dollars for contempt in disobeying the former order of the Court.

ARIZONA NOTES.—A letter from the Deputy Postmaster at El Dorado Cañon, Jan. 24th, gives these items:

Placer gold has been found in the neighborhood. This is the first that has been discovered in this place and Calville. The steamer Esmeralda recently landed seventy-five tons of freight for Pahranaagat. Two quartz mills formed a part of this.

A great many hungry Montana miners are passing daily.

COAL FROM WASHINGTON TERRITORY.—A sample of coal from the Phoenix mine, near Cape Flattery, was brought to this city by Mr. Francis, recently from Victoria. It is said to be superior to any heretofore discovered on the coast.

R. H. DUNNING'S BOX RIFLE.—We have seen a letter from R. H. Penrose, Secretary of the What Cheer Mining Co., at Relief Hill, Nevada county, in which he speaks highly of this patent rifle. He says that the last time they cleaned up, they found one piece of gold in the box worth nineteen dollars.

The *Mining and Scientific Press* is all that its publishers claim for it, being a compendium of mining news on the Pacific Coast, and a general disseminator of all matters of interest to the mechanical and agricultural portions of the State.—*Dutch Flat Enquirer*.

## TO MINERS, MILLWRIGHTS AND FARMERS.

We beg leave to call your especial attention to the  
**EXCELSIOR**  
Double-Acting Suction and Force Pump.  
Hooker's Patent, Aug. 15, 1865.

This Double-Acting Suction and Force Pump, the best in use, is more simply constructed, more durable, and has larger and more direct ports for receiving and discharging water, and is warranted to furnish more water, than any other Pump of equal caliber. It has Puppet Valves, faced with vulcanized rubber, which cannot be wrongly placed in the Pump. The valves can be changed without disconnecting air-chamber, suction or discharge pipes.

In case of necessity, the Pump can be run at any high rate of speed, and will furnish water proportionately. The Excelsior Pump is equally adapted to use for surface and deep wells or shafts. It can be run by windmill or horse power for irrigating purposes; also by hand or steam power on steamers and ships. For domestic use, no better Pump can be found.

Fig. 3.

Fig. 3 represents a Hand Pump, which works very easy, and with even power. Fig. 4 is a 6-inch Mining Pump, showing adjustable bonnet of the valve chest.

For Circulars, or further particulars, inquire of or address J. W. BRITTAN & CO., Agents, 120 Front street, San Francisco; H. J. BOOTH & CO., Union Iron Works, First street, or  
1am CUSHING & CO., Prop'rs, San Francisco.

## California Academy of Natural Sciences.

### REGULAR MEETING.

SAN FRANCISCO, Feb. 18, 1867.

President in the Chair.

Messrs. I. W. Raymond, Rodman, Gibbons, Thos. H. Selby, Daniel Knight, Dr. F. H. Holman, Edmund Scott, Henry Edwards, John Melville, Geo. Daly, Robinson Gibbons, Gregory Yale, Jas. Howden, Geo. Filmore, Marshall Eastings, John L. Eckley and Lee J. Ransom, were elected resident members; Dr. J. G. Cooper was elected a life member.

Mr. Gates presented the skull of a Digger Indian taken from an old Indian burial ground.

Prof. Blake read a paper concerning some fossil elephant's teeth found on the Northwest Coast of this continent, in the neighborhood of Behrings Straits, stating that the point where these teeth were found is the farthest north at which elephant remains have been found in North America.

Dr. Gibbons made some interesting remarks on the poor quality of the macadamizing material employed on the streets of this city, and inquired if any person knew of the existence of any better material for that purpose.

Prof. Whitney replied that the State Geological Survey had paid particular attention to that matter, and had instituted a careful examination in that direction. The nearest locality at which any suitable macadamizing material can be obtained, is at a point near Petaluma, where an excellent quality of trap rock is found, in great abundance, and at a point convenient for shipment.

Mr. Falkenau read a very interesting paper on "Peat," which will be found in full, on another page. That paper elicited considerable discussion, during which Mr. Bolander remarked that he had found the moss plant, from which peat was generally produced, growing on the coast and in the Sierras, and had seen limited deposits resembling peat in various localities; but he doubted whether it was the real peat. He further stated that owing to the frequent washes in the mountains by our heavy rains, the peat formations were interspersed with layers of sand, which greatly impaired their value for fuel. Mr. Keys said he understood the peat formations round the bay were impregnated with salt to such a degree as to put out the fire when it was attempted to burn it. Dr. Behr said there were formations of peat near Moore's Landing, Alameda, which the inhabitants there used for fuel. Several members expressed doubts as to the probability of obtaining any great supply of peat in this State, and referred to the newspaper notices on the subject with surprise.

Prof. Whitney made some remarks supplementary to his communication in 1862, as to which was the highest mountain in the

United States, and which was the highest in North America. He claimed that California had the highest mountain in the United States, and that Popocatepetl was the highest in North America, but in mass of mountains California excelled the Mexican Cordilleras. Prof. Whitney exhibited an apparatus for boiling water in such a way as to show the height of mountain elevations; also a short (24 inch) barometer, which was more conveniently carried in the mountains than the long or 29-inch instrument.

Adjourned.

**MEDICATED INHALATION.**—Of late years various devices have been employed to secure a successful means of reaching the disorders of the throat, bronchial tubes and lungs, by inhalation. The latest French device has been to inhale fluids in the form of fine spray, by forcing the fluids through exceedingly fine openings—a process known as pulverization. This is, at best, a disagreeable method, and often risky; as it is evident that thereby other parts, not intended to be acted upon, may become affected. What is wanted is a more perfect system of pulverization—one by which, without effort and without interruption to the occupation of the patient, the desired medicine can be administered in a finely diluted state, in which it can act in a gradual and natural manner on the throat and lungs. Professor Fleury, of New York city, has invented and patented an apparatus which seems to meet this want most perfectly. It consists of a globular vessel, partly filled with water and suspended over a lamp, by an attachment connected with the lamp itself. This apparatus is so arranged that when the lamp is lighted, a jet or jets of steam is forced out through the medicated matter, whether of herbs or any other preparation, so that the aroma is diffused through the apartment and naturally inhaled. The steam is at the same time made the medium by which the healing substances are extracted. The condensation of steam will also absorb the carbonic acid, and other poisonous gases in the room, at least all such as are soluble in water. The same device can also be employed to drive out mosquitos or vermin, or for fumigation purposes.

**MINING BUREAU.**—The bill now before Congress, introduced by Senator Stewart of Nevada, and Representative Higby, of California, provides for the establishment of a Mining Bureau, "the general design and duties of which shall be to acquire and diffuse among the people of the United States useful information on subjects connected with mines and mining, in the most general and comprehensive sense of these words." Such a department as this in connection with the Government, is certainly a desideratum in this country, if any where. We hope that our Representatives will never desist from harping upon the matter until something is done worthy of the Congress which makes laws for the most extensive mining country in the world.

We have to acknowledge the receipt, from O. H. Grey, of the Report of the Nevada State Treasurer.

## The Sauce Mine. Lower California.

This mine is located in the Comodon district, on the Gulf side of the Peninsula, about 180 miles above La Paz and fourteen from the Bay of San Bruno. The company have quite an extensive mining property, embracing in all six distinct lodes. Title is obtained through a Mexican grant, which has been occupied as a homestead for over thirty years. The locality is said to be well supplied with wood and water. The facilities for shipping are very favorable, there being a good port at the Bay of San Bruno, only fourteen miles distant, affording a safe harbor for the largest ships. The steamer John L. Stephens frequently stops there to land passengers and freight.

The principal lode is known as the Sauce mine, which presents some most remarkable characteristics. The copper in this lode is chiefly native and disseminated throughout the entire mass of the vein rock, mostly in thin plates or laminae, ranging in thickness from that of a sheet of tissue paper, in infinitesimally small scales, up to sheets a quarter or half an inch thick. The gangue consists of a kind of friable mica schist, the chief portion of which is mica, in small scales, easily broken to pieces with a pick. We know of but one other mine in the world carrying a similar gangue, and that a very rich one in Mariposa county in this State. Interspersed through the gangue is also found, in fine granular form, a rich sulphuret of copper, highly vitreous in appearance, and which is easily separated from the gangue by stamping and concentrating; as is also the chief portion of the native copper.

A small 4-stamp prospecting mill has been erected near this mine, in which 100 tons of the ore have been crushed, to test its value. The mine has been developed to the depth of 114 feet in the deepest shaft, (No. 1); at which point the lode is seven feet wide, yielding a fair average of native copper, accompanied with the vitreous sulphide. At 56 feet in depth in this shaft a drift has been extended 100 feet on the course of the vein, in one direction, and in the same direction another drift has been run 120 feet, commencing at a point ninety-six feet from the surface. The direction of the lode is north ten degrees east, with an easterly dip of sixteen degrees from a vertical line. Shaft No. 2 has been sunk on the course of the ledge, 21 feet deep and 462 feet north of shaft No. 1. Shaft No. 3 has been sunk twenty-one feet south of No. 1 and fifty-six feet in depth. The ledge is said to average about fourteen feet in thickness. The entire claim is 2,625 feet in length.

The 100 tons of ore crushed has yielded an average of \$44 per ton in value of native metal and workable mineral. Should the average thickness of the mine continue as indicated by the above figures, with the same per ton of metal and ore, it would indicate a yield of the mine, if worked to the depth already opened, of several millions of dollars. We have heard more or less of this mine for the past three years, and taking the accounts to be correct, it promises at no future day to prove one of the most valuable mines on the Pacific coast.

## Conveyance of Mining Claims.

The *Pacific Law Magazine* for January contained a report of the decision of the Supreme Court, in *Goller, et al. vs. Felt, et al.*, in which the title to a mining claim was involved. The decision was to the effect that the Act of April 13th, 1860, made a written instrument, in the conveyance of a mining claim, mandatory, and that conveyance by parol was thereby excluded, and of no value against a subsequent written conveyance. The February number of the same journal contains a letter from W. R. Boncher, of Mokelumne Hill, in which he states, that although the Act referred to appears on the Statute Book, it never passed the Senate, and is, therefore, not a law! The *Senate Journal*, page 596, shows that the bill was indefinitely postponed.

The bill was duly certified by the President of the Senate, and the Speaker of the House, and was approved by the Governor. In a certain similar case, the Supreme Court ruled that it could not go behind the record which showed these points, and that, therefore, the law must be treated as having been actually passed by the Legislature. The Act of April 13th, 1860, must, then, be considered the law in regard to such conveyances.

We copy it for the benefit of our readers:

Conveyances of mining claims may be evidenced by bills of sale or instruments in writing not under seal, signed by the person from whom the estate or interest is intended to pass, in the presence of one or more attesting witnesses; and also conveyances of mining claims heretofore made by bills of sale or instruments of writing, not under seal, shall have the same force and effect as *prima facie* evidence of sale, as if such conveyances had been made by deed under seal; *provided*, that nothing in this act shall be construed to interfere with or repeal any lawful local rules, regulations, or customs of the mines in the several mining districts of this State; and *provided*, further, every such bill of sale or instrument in writing shall be deemed and held to be fraudulent and void as against all persons except the parties thereto, unless such bill of sale or instrument in writing be accompanied by an immediate delivery to the purchaser of the possession of the mining claim or claims therein described, and be followed by an actual and continued change of the possession thereof, or unless such bill of sale or instrument in writing shall be acknowledged and recorded as required by law in the case of conveyances of real estate.

The *Colusa Sun* urges the planting of forest trees. It estimates the price of wood five years hence as double what it is now. One-half the wood has already been cut from the Sacramento and San Joaquin rivers as far up as they are navigable, and more than half the oak timber along the lines of the Sacramento Valley and Pacific Railroads.

**REDUCTION IN PRICES OF ASSAYS.**—The attention of our readers is called to the advertisement, in another column, of the San Francisco Assaying and Refining Works. It will be seen that the charges for unparted gold bars are one-half less than those which have so long ruled, and other charges in proportion.

## The Mineral Lands.

CIRCULAR IN RELATION TO MINING CLAIMS UNDER THE ACT OF CONGRESS APPROVED 26TH JULY, 1866. [U. S. STATUTES, PAGE 251, CHAPTER CCLXII.]

DEPARTMENT OF THE INTERIOR,  
GENERAL LAND OFFICE, January 14, 1867.

GENTLEMEN:—Herewith will be found the act of Congress approved 26th July, 1866, "granting the right of way to ditch and canal owners over the public lands, and for other purposes."

By the first section of this act all the mineral lands of the United States, surveyed and unsurveyed, are laid open to all citizens of the United States and to those who have declared their intention to become such, subject to statutory regulations, and also to the local customs and rules of miners in the several mining districts, not in conflict with the laws of the United States.

It therefore becomes your duty *in limine* to acquaint yourselves with the local mining customs and usages in the district in which you may be called upon to do those official acts which are required by the law, whether the same are reduced to authentic written form or are to be ascertained by the testimony of intelligent miners, which you are to obtain as occasion may require and justify in acting upon individual claims, a perfect record whereof is to be carefully taken and preserved by the Register and Receiver, and to be accompanied by a diagram or plat fixing the out-boundaries of the district in which such customs and usages exist.

The 2d section of the Act declares that "Whenever any person, or association of persons, claim a lode of quartz or other rock, in place, bearing gold, silver, cinnabar, or copper, having previously occupied and improved the same, according to the local customs or rules of miners in the district where the same is situated, and having expended in actual labor and improvement thereon an amount of not less than \$1,000, and in regard to whose possession there is no controversy or opposing claim, it shall and may be lawful for said claimant, or association of claimants, to file in the local Land Office a diagram of the same, so extended, laterally or otherwise, as to conform to the local laws, customs and rules of miners, and to enter such tract and receive a patent therefor, granting such mine, together with the right to follow such vein or lode, with its dips, angles and variations, to any depth, although it may enter the land adjoining, which land adjoining shall be sold subject to this condition."

Mining claims may be entered at any District Land Office in the United States, under this law, by any person or association of persons, corporate or incorporate. In making the entry, however, such a description of the tract must be filed as will indicate the vein, or lode, or part, or portion thereof claimed, together with a diagram representing by reference to some natural or artificial monument, the position and location of the claim and the boundary thereof, so far as such boundaries can be ascertained.

First—In all cases the number of feet in length claimed on the vein or lode shall be stated in the application filed as aforesaid, and the lines limiting the length of the claim shall also in all cases be exhibited on the diagram, and the course or direction of such end lines, when not fixed by agreement with the adjoining claimants, or by the local customs or rules of the miners of the district, shall be drawn at right angles to the ascertained or apparent general course of the vein or lode.

Second—Where, by the local laws, customs or rules of the miners of the district, no surface ground is permitted to be occupied for mining purposes except the surface of the vein or lode, and the walls of such vein or lode are unascertained, and the lateral extent of such vein or lode unknown, it shall be sufficient, after giving the description and diagram aforesaid, to state the fact that the extent of such vein or lode cannot be ascertained by actual measurement, but that the said vein or lode is bounded on each side by the wall of the same, and to estimate the amount of ground contained between the given end lines and the unascertained walls of the vein or lode, and in such cases the patent will issue for all the land contained between such end lines and side walls, with the right to follow such vein or lode, with all its dips, angles and variations to any depth, although it may enter the land adjoining, provided the estimated quantity shall be equal to a horizontal plane bounded by the end lines, and the walls on the sides of such vein or lode.

Third—Where by the local laws, customs or rules of miners of the district, no surface ground is permitted to be occupied for mining purposes except the surface of the vein or lode, and the walls of such vein or lode are ascertained and well-known, such walls shall be named in the description and marked on the diagram, in connection with the end lines of such claim.

Fourth—Where by the laws, customs or rules of miners of the district, a given quantity

of surface ground is fixed for the purpose of mining or milling the ore, the aforesaid diagram and description in the entry shall correspond with and include so much of the surface as shall be allowed by such laws, customs or rules for the purpose aforesaid.

Fifth—In the absence of uniform rules in any mining district limiting the amount of surface to be used for mining purposes, actual and peaceable use and occupation for mining or milling purposes shall be regarded as evidence of a custom of miners authorizing the same, and the ground so occupied and used in connection with the vein or lode, and being adjacent thereto, may be included within the entry aforesaid and the diagram shall embrace the same as appurtenant to the mine.

Where the claimant or claimants desire to include within their entry and diagram any surface ground beyond the surface of the vein, it shall be necessary upon filing the application to furnish the Register of the Land Office with proof of the usage, law or custom under which he or they claim such surface ground, and such evidence may consist either of the written rules of the miners of the district, or of the testimony of two credible witnesses to the uniform custom or the actual use and occupation as aforesaid, which testimony shall be reduced to writing by the Register and Receiver, and filed in the Register's office with the application, a record thereof to be made as contemplated under the first head in the foregoing.

By the 3d section of the act it is required that upon the filing of the diagram, as provided in the 2d section, and posting the same in a conspicuous place on the claim, with notice of intention to apply for a patent, the Register shall publish a notice of the same in a newspaper nearest the location of said claim, which notice shall state the name of the claimant, name of mine, names of adjoining claimants on each end of the claim, the district and county in which the mine is situated, informing the public that application has been made for patent for same; the Register also to post such notice in his office for ninety days.

Thereafter, should no adverse claim have been filed, it will become the duty of the Surveyor General upon application of the party to survey the premises and make plat thereof, endorsed with his approval, designating the number and description of the location, the value of the labor and improvements, and the character of the vein exposed. As preliminary to the survey, however, the Surveyor General must estimate the expense of surveying, planting, and ascertain from the Register the cost of publication of notice, the amount of all of which must be deposited by the applicant for survey with any Assistant United States Treasurer or designated depository in favor of the United States Treasurer, to be passed to the credit of the "Fund Created by Individual Depositors for the Surveys of the Public Lands."

Duplicate certificates of such deposits must be filed with the Surveyor General for transmission to this office, as in the case of deposits for surveys of public lands under the tenth section of the act of Congress approved May 30, 1862, and joint resolution of July 1, 1864.

After the survey thus paid for shall have been duly executed, and the plat thereof approved by the Surveyor General, designating the number and the description of the location, accompanied by his official certificate of the value of the labor and improvements, and character of the vein exposed, with the testimony of two or more reliable persons cognizant of the facts on which his certificate may be founded, as to the value of the labor and improvements, the party claiming shall file the same with the Register and Receiver, and thereupon pay to the said Receiver five dollars per acre for the premises embraced in the survey, and shall file with these officers a triplicate of deposit showing the payment of the cost of survey, plat and notice, with satisfactory evidence which shall be the testimony of at least two credible witnesses, that the diagram and notice were posted on the claim for a period of ninety days, as required by law. Thereupon it shall be the duty of the Register to transmit to the General Land Office said plat, survey and description, with the proof endorsed as satisfactory by the Register and Receiver, so that a patent may issue—if the proceedings are found regular—but neither the plat, survey, description, nor patent shall issue for more than one vein or lode.

The utility of the surveying system is to be maintained by extending over the mining districts the rectangular method, at least so far as township lines are concerned.

The contemplated surveys of the mineral lands will be made by District Deputies under contracts, according to the mode adopted in the survey of the public lands and private land claims, embracing in them all such veins or lodes as will be called for by claimants entitled to have them surveyed.

In consideration of the very limited scope of surveying involved in each mining claim, the per mileage allowed by law may not be adequate to secure the services of scientific surveyors,

and hence the necessity of resorting to a per diem principle, it being the most equitable under the circumstances.

The Surveyor General is therefore hereby authorized to commission resident mineral surveyors for different districts, where isolated from each other and absolutely inconvenient for one surveyor promptly to attend to the several calls for surveying such localities, the compensation not to exceed ten dollars per diem, including all expenses incidental thereto. Such surveyors shall enter into \$10,000 bonds for the faithful performance of their duties in surveying such claims as the Surveyor General may be required to execute in pursuance of the aforesaid law and these instructions.

The 4th section contemplates the location and entry of a mine upon unsurveyed lands, stipulating for the surveys of public lands, to be adjusted to the lines of the claims according to the location and possession and plat thereof. In surveying such claims the Surveyor General is authorized to vary from the rectangular form to suit the circumstances of the country, local rules, laws and customs of miners. The extent of the locations made from and after the passage of the act shall, however, not exceed 200 feet in length along the vein for each locator, with an additional claim for discovery to the discoverer of the lode, with the right to follow such vein to any depth, with all its dips, variations and angles, together with a reasonable quantity of surface for the convenient working of the same as fixed by local rules. Provided, no person may make more than one location on the same lode, and no more than 3,000 feet shall be taken in any one claim by any association of persons.

The Deputy Surveyors should be scientific men, capable to examine and report fully on every lode they will survey, and to bring in duplicate specimens of the ore, one of which you will send to this office and the other the Surveyor General will keep to be ultimately turned over, with the surveying articles, to the State authorities.

The Surveyors of mineral claims, whether on surveyed or unsurveyed lands, must designate those claims by a progressive series of numbers beginning with No. 37, so as to avoid interference in that respect with the regular sectional series of numbers in each Township, and shall designate the four corners of each claim, where the side lines of the same are known, so that such corners can be given, by either trees, if any are found standing in place, or any corner rocks exist in place, or posts may be set diagonally and deeply imbedded, with four sides facing adjoining claim, sufficiently flattened to admit of inscriptions thereon; but where the corners are unknown it will be sufficient to place a well built, solid mound, at end of the claim. The beginning corner of the claim nearest to any corners of the public surveys is to be connected by course and distance, so as to ascertain the relative position of each claim, in reference to Township and range when the same have been surveyed, but in those parts of the surveying district where no such lines have as yet been extended, it will be the duty of the Surveyor General to have the same surveyed and marked, at least so far as standard and Township lines are concerned, at the per mileage allowed, so as to embrace the mineral region and to connect the nearest corners of the mineral claims with the corners of the public surveys.

Should it, however, be found impracticable to establish independent base and meridian lines, or to extend township lines over the region containing mineral claims required to be surveyed under the law, then and in that case you will cause to be surveyed, in the first instance such a claim, the initial point of which will start either from a confluence of waters, or such natural and permanent objects as will unmistakably identify the point of the beginning of the survey of the claim, upon which other surveys will depend.

Section 5 provides that in cases where the laws of Congress are silent upon the subject of rules for working mines, respecting easements, drainage and other necessary means to the complete development of the same, the local legislation of any State or Territory may provide them, and in order to embody such enactments with patents, you are directed to communicate any such laws to this office.

Section 6. Should adverse claimants to any mine appear before the approval of the survey, all further proceedings shall be stayed until a final settlement and adjudication are had in the Courts of the rights of possession to such claim, except where the parties agree to settlement, or a portion of the premises is not in dispute, when a patent may issue as in other cases.

Section 7 provides for such additional land districts as may be necessary; Section 8 for the right of way; Section 9 for the protection of rights to the use of water for mining, agricultural, manufacturing or other purposes, for the right of way for the construction of ditches and canals, and makes parties constructing such work, after the passage of this act, to the injury of settlers, liable in damages.

Section 10. Homesteads made prior to the passage of this act by citizens of the United States or persons who have declared their intention to become citizens, but on which lands no valuable mines of gold, silver, cinnabar or copper have been discovered, are protected so that settlers or owners of such homesteads shall have a right of a pre-emption thereto, in quantity not to exceed 160 acres, at \$1.25 per acre, or to avail themselves of the Homestead Act and acts amendatory thereof.

Section 11 stipulates that upon the survey of the lands in question, the Secretary of the Interior may set apart such portions as are already agricultural, and thereafter subject such agricultural tracts to pre-emption and sale as other public lands.

In order to enable the Department properly to give effect to this section of the law, you will cause your Deputy Surveyors to describe in their field notes of survey, in addition to the date required to be noted in the printed manual of surveying instructions, on pages 17 and 18, the agricultural lands, and represent the same on township plats by the designation of "agricultural lands."

It is to be understood that there is nothing obligatory on claimants to proceed under this statute, and that where they fail to do so, there being no adverse interest, they hold the same relations to the premises they may be working which they did before the passage of this act, with the additional guarantee that they possess the right of occupancy under the statute.

The foregoing presents such views as have occurred to this office in considering the prominent points of the statute, and will be followed by further instructions, as the rulings in actual cases and experience in the administration of the statute may from time to time suggest.

Very respectfully your obedient servant,  
Jos. M. Wilson, Commissioner.  
To the United States Registers and Receivers and Surveyors General.

**DABOLL'S STEAM FOG TRUMPET.**—Our readers will remember our mention in a former issue, that one of these instruments had been ordered for the entrance to our harbor. It has arrived, and preparations for its erection are nearly completed. The building for its reception is about a third of a mile north of Arch Rock. It is a huge brazen trumpet, shaped like a fireman's, is about six feet long, and has in the "mouth-piece" a steel tongue, which vibrates when a column of air is forced through, giving a hoarse, unearthly blast, which can be heard for fifteen miles. It is worked by a small Ericsson engine. The furnace is kept constantly heated, and a watchman is always on hand to set it in operation upon occasion of fog by day, or darkness by night. This is a private enterprise of the Pacific Mail Steamship Company. The cost will be some \$5,000, besides the expense of keeping it up. Such a thing has long been needed, for the old fog bell was not always to be relied upon. It may be the salvation of many a poor fellow, who will in his heart bless, not the Government, but the P. M. S. Co. Without casting any reflection upon this company, it may be said, with truth, that in this case, at least, it is "bound to toot its own horn."

**SALT.**—Edward Gilman, says the Reese River *Reveille*, recently visited the Salt Mountain, situated sixty to seventy miles southeast of Pahranaagat. The salt lies under several feet of soil, which is removed and the solid deposit of beautiful salt is blasted in the same manner that ordinary rock is blasted, and is thrown out in huge blocks. Gilman brought in a number of fine large cubes of the salt. It is being worked slightly at present for the Pahranaagat District, to which it is hauled over a practicable road.

**JOHN PATTISON**, Superintendent of the Cunningham mine, near Nevada City, has devised an arrangement for the safety of the cars on inclines, similar to that used in shafts to prevent the falling of the cage in case of breaking of the rope.

A TWENTY-INCH navy gun, recently cast in Philadelphia, was successfully tested with charges of sixty, eighty, and one hundred pounds of powder, the shot weighing over one thousand pounds.

THE Utah Legislature have been laying before Congress the wonderful moral influence of polygamy.

## Scientific Miscellany.

(Reported for the Mining and Scientific Press.)

## Peat.

[Read before the California Academy of Natural Sciences, February 15th, 1907, by Louis Falkenau, of the Pacific Chemical Works.]

Ranking first among the most important conditions for the development of our race, the artificial production of heat has always been of the utmost importance to mankind; and I do not fear to incur the reproach of exaggerating, if I go so far as to say, that the history of civilization is closely allied to the gradual perfection of the means and ways of creating artificial heat.

Light and heat are indispensable, directly and indirectly, to the proper development of man; and the amount of both, offered by natural phenomena, does not suffice to elevate him far above the brute creation. Already, in the most remote periods of our existence as a race, as far as its records or its foot-prints, traced by the indefatigable eye of scientific research, are able to show, man has pressed his enemy, the flames, into his service, to prepare his food and to obtain the warmth necessary to his existence, when and where nature did not supply it. From these primitive uses the mighty agent heat has gradually but steadily been brought to bear upon all that the human mind has devised in the ages which elapsed, until it had reached its present compass, and to-day we find ourselves entirely dependent upon it for all that every-day life requires.

With the constant increase in the application of heat, the demand for fuel necessarily keeps pace, and all realms have been ransacked in search of materials which might serve as such. As in the great harmonious organism of nature, each want meets its supply, substances adapted for fuel are abundantly met with, and by some exercise of economy and judgment, by the utmost utilization of material, the vegetable and mineral sources of fuel should suffice to meet all our wants. Still, the vast consumption of fuel, in the civilized portion of our globe, has called into the field all our powers of scientific and practical knowledge, to increase our stock of caloric material, and to obtain therefrom its utmost yield of heat. How much there is still left undone in that direction, is proved by the fact, that according to a reliable author, 3,000,000 tons of coal are annually wasted in England, in the smelting of iron alone.

The forests, which for ages were the self-replenishing source of fuel, have been sadly thinned under the footsteps of civilization, and of course rarest and most distant in the densely populated districts where the largest demand for that fuel exists.

The fossil remains of vast forests, appertaining to distant periods of our terrestrial epoch, are now our chief resource, and coal in its different strata is wrought from the bowels of the earth to be consumed in the creation of heat.

Intermediate between wood and coal, we find a substance which, so to say, forms the transition from the former to the latter, viz., *PEAT*, which lately has become of some importance in our industrial economy. The formation of peat, which is constantly progressing, seems to be destined to provide new and vast deposits of fuel for a far distant period, when our coal beds shall have been partially exhausted, or become more difficult of access. The generation of peat takes place under conditions which vary as much as the nature of the product resulting from it.

Large, shallow and stagnant pools or marshes, are generally its birth-place. The lower orders of plants, which they produce after losing their vital powers, are gradually decomposed into their fundamental elements or binary combinations, of which those in form of gases escape; those soluble in water are dissolved, while the insoluble, non-volatile, remain as part constituents of a carboniferous sediment at the bottom of the pool. Generations upon generations of such plants succeed to each other, undergoing the same changes. On the banks of the pool, plants of higher orders find conditions favorable to their growth, and, encroaching

upon its banks, they add their stems, leaves, branches or trunks, to swell the carboniferous deposit. Gradually the pool is thus filled or reduced in its depth, and finally changed into mire. Higher classes of plants now follow, and finally numerous generations of these transform this great cemetery of plants into a more compact mass, rich in carbon, which we term peat.

Such is one mode in which peat may be formed; but, as aforesaid, the *modus* may greatly vary, according to the conditions offered by the soil, the climate, the species of vegetation peculiar to a locality, etc.

I purposely abstain from entering upon the botany of peat formation, as I would leave this point to be elucidated by members of the Academy, better qualified for the task; and the same reasons deter me from entering upon its geology, or attempting to draw conclusions as to the mode in which coal may have been generated, from the apparently similar process of the formation of peat.

Inundations by rivers or by the sea, frequently appear to give rise to the formation of peat deposits, which often cover immense areas. In these peat beds, layers of gravel, clay, shells, etc., often mark, interposing between different strata of peat, the different inundations which gave rise to them. The largest peat fields in the north of Germany cover two or three hundred square miles, and have an average depth of twenty feet. Great Britain contains 6,000,000 acres of peat ground, of an average depth of twelve feet, equal to 3,600 tons per acre, or a total of 21,600,000,000 tons.

The theory of peat formation indicates that it takes place to its greatest extent in the temperate zone, where stagnant pools may exist, as the evaporation by the heat of the sun does not interfere, and no great depression of temperature tends to hinder or retard the decomposition of organic matter.

Before I pass over to a more special description of the properties of peat, its applications, etc., I must mention that even to some of the more abstract, speculative sciences, peat deposits have proved of great interest. To the archaeologist, they have yielded rich harvests of utensils, weapons, etc., of past ages, and even one of the most celebrated linguists, Dr. Mueller, in his valuable work on the origin of languages, draws his conclusions as to the period of Indo-Germanic immigration into the north of Germany, from the order in which different species of trees follow upon each other, in the peat deposits of that region. No doubt my fellow members will be able to give us some interesting details on these subjects.

We generally distinguish "recent peat," and "older peat," the former being in a less advanced stage of decomposition, and bearing distinct marks of its origin in the shape of roots, leaves, stems, etc., still intact; the latter presenting a uniform mass, of greater density and darker color. Numerous names have been devised for different kinds of peat, such as grass peat, rush peat, etc.

All peat contains, in its natural state, a large amount of hygroscopic water, and of foreign mineral substances, derived from the soil. The former amounts, in the best kinds, to twenty-five per cent.; the latter varies from one to thirty-three per cent., and its specific gravity deviates from 0.1 to 1.039, the oldest being the most dense. The amount of carbon (its most valuable component) is exceedingly variable, and, in the best kinds, reaches as high as sixty-one per cent.

The value of peat as fuel depends entirely upon the proportion of carbon, of mineral substances, and of water contained in it; both of the latter impairing its value, not only by increasing its bulk, but also occasioning a loss of part of the heat, which the carbon contained in it might yield, as the water absorbs a certain amount of heat in being transformed into vapor, while the mineral substances, by enclosing the particles of carbon, render their perfect combustion more difficult. These deteriorating components have greatly impeded the introduction of peat in the arts and manufactures. Yet, by drying the crude product, by washing and compressing it, its objectionable qualities may be greatly modified, and the product thus obtained, the "pressed peat," or "machine peat," has found manifold application as well as the better kinds of peat.

By charring peat in a similar manner as wood is charred, or coal transformed into coke, a valuable product—peat charcoal—is obtained. The value of the best kind of peat for caloric purposes, compared to wood, is almost double that of the latter, four-fifths that of charcoal, equal to brown coal, and about four-fifths that of anthracite, while the poorest quality only reaches about one-third of those figures. Besides the

components hitherto named, peat often contains other ingredients, resulting from incomplete decomposition of organic matter. None of these, however, are of great importance. If peat is subjected to dry distillation—that is, heating under exclusion of air—it yields pyroligneous acid, empyreumatic oils, paraffine, carbonic acid, ammonia, solar oil, photogen, etc. This fact has led to its distillation, on a large scale, to obtain these products. Illuminating gas has also been made from it. For metallurgical purposes, peat charcoal has been used to some extent, especially in the manufacture of iron.

The foregoing is all I can say on the subject without entering into technical details. Such as it is, I hope it may lead to the discussion of some points which more strictly appertain to natural sciences, and may serve to further elucidate; that objects of technological research may prove of interest to the naturalist, and that the great principle of the universality of science, which characterizes our age, is constantly interweaving the different disciplines of human knowledge, making them subservient to each other, while it links them, inseparably, to the triumphal chariot of progress, enlightenment and civilization.

NOTE.—Researches are now in progress at the laboratory of the Pacific Chemical Works as to the value of different species of peat found in California, which, when completed, will be communicated to the Academy by Messrs. Falkenau & Hanks.

## Metals which Alloy with Iron.

**GOLD AND IRON** readily unites by fusion and in all its states, as malleable iron, cast iron, and steel. The gold facilitates the fusion of iron. By stirring gold in a state of fusion with an iron rod, it will dissolve a small quantity of the iron. The presence of gold produces no bad effect upon the iron. Equal parts of gold and iron give a grayish, brittle mass that is attracted by the magnet. Six parts of gold and one of iron form a white alloy which is ductile when cold, and with a moderate heat becomes red, yellow and blue. Nine parts of iron and one part of gold form an alloy which resists the file unless previously subjected to a red heat. With twenty-eight parts of iron and eight of gold the alloy is of a silver white color and rather more ductile than iron. Eleven parts of gold and one of iron form a very ductile alloy, but harder than gold and of great resisting power. It is of a pale yellowish gray color, inclining to a dirty white. When the alloy contains one-twelfth of iron, it is of a pale yellowish color; when containing from a fifth or sixth, it is of a yellow gray color. An alloy of three or four parts of iron for one of gold is of grayish white color and very hard.

**SILVER AND IRON.**—An alloy of equal parts of iron and silver has the color of silver, considerable ductility, great hardness, and less elasticity than silver. Silver combined with one-fifth of iron becomes hard and loses its tenacity and malleability. It has been asserted that an addition of fifteen per cent. of fine silver to iron during the refining operation sensibly deteriorates the quality of the iron, and during the process of forging, the metal becomes scaly, cracked at the edges, and resembles hot-short iron. This would imply that it had in some slight degree the same effect as sulphur on the iron.

**PLATINUM AND IRON** combine readily. Native platinum is often found alloyed with iron. Platinum unites more readily with pig iron than with ductile iron. With three parts of pig iron and one part platinum the alloy is excessively hard, but possesses some ductility. With equal parts of iron and platinum it forms a crystalline alloy quite fusible, susceptible of a fine polish that does not tarnish in the air. Platinum combined with iron is readily acted upon by acids and is completely dissolvable in nitric acid.

**LEAD AND IRON** do not readily combine. It has been the subject of many experiments, but with no marked results. Dr. Ure affirms that iron does not unite with lead so long as both those substances preserve the metallic form. Iron ores frequently contain lead. If lead be added to an alloy of iron and silver, the lead seizes upon the silver, and isolates the iron, which will swim on the surface of the lead and silver.

**ZINC.**—An alloy of iron and zinc is doubted by many chemists. It would seem almost impossible to unite them, the one being refractory and the other somewhat volatile. The alloy of the two metals is often found in certain ores. According to M. Hekeln, zinc and iron form an alloy, hard, sensible to the magnet, and resembling silver. But he does not indicate the proportion of the two metals, nor the manner in which the combination is effected; it would seem possible that the zinc might be added to the iron when the latter is in a state of fusion,

but the zinc will be volatilized by the high temperature of the molten iron.

**ALUMINUM** combines with iron. A mixture containing 0.064 of aluminum and some of carbon by being kept under fusion during a considerable time, produced a mixture of highly carburized steel aluminum. The alloy is white, very brittle, and with a granular texture. Aluminum does not seem to exert an injurious influence on the tenacity of the iron.

**ANTIMONY AND IRON** readily unite by fusion. The two metals have great affinity for each other. Their alloys are more fusible than iron, and are white, hard and very brittle. An alloy of one part of antimony to one hundred parts of cast iron produces a grayish white alloy, and on being filed, of a bright steel-gray color. An alloy of two parts antimony and one hundred of iron produces a very hard, brittle alloy, of a gray white color, with but little luster. Of three parts antimony and one hundred of iron, very brittle and of a grayish white color, somewhat brilliant. With five per cent. of antimony the fracture of the alloy resembles that of zinc.

**COPPER AND IRON** have little affinity for each other. It is difficult to unite them directly on account of the refractory nature of the iron. By melting the two metals together, it is found that the iron unites with the copper in the form of grains. The alloy is gray and brittle. A forty-eighth part of iron renders copper magnetic. Copper augments the tenacity and hardness of the iron.

**TIN** unites into alloy with iron in all proportions. With equal parts of tin and iron it gives a brittle mass of grayish-white color, with a granulated fracture. Two parts iron and one of tin give an alloy not very malleable and too hard to be pared with a knife. Twenty-one parts of tin and one of iron is very malleable, but harder than tin and not so brilliant. With one part of iron and two of tin, the alloy has a dark gray fracture and is attracted by the magnet. With five parts of tin and one of iron is called Biber's alloy, and is used for tinning copper. It is slightly malleable when cold, brittle when hot, has a steel-gray granular texture, and may be cut with scissors. It can be made by melting together tin and the shavings of tin plate. Cast iron containing tin is very sonorous, receives a beautiful polish, has a texture as fine as steel, is very hard, does not break as readily or rust as easily as common cast iron.

**MANGANESE** unites readily with iron; where the proportion of the latter metal is considerable, it makes iron harder, whiter, and more brittle. Iron in alloy with this metal is the best for making steel. Manganese diminishes the fusibility of iron and increases its ductility. An alloy composed of 0.745 of iron and 0.255 of manganese is whiter than iron, shining, very brittle, and has a fine grain.

**MOLYBDENUM** unites with iron the most readily of all metals. With equal parts of each, the alloy is fusible with the blow-pipe, of a bluish-gray color, quite hard and brittle. One part of iron with two parts of molybdenum forms a combination of a clear gray color, but not fusible with the blow-pipe, very brittle, of fine granulous texture, and obeying the magnet. An alloy containing 0.20 of molybdenum is fusible, whiter than iron, extremely hard and brittle, and of great tenacity, the fracture being equal and granulous.

**NICKEL** unites readily with iron and produces a soft and tenacious alloy. Five parts of nickel and two parts of iron give an alloy moderately hard, quite malleable, and of the color of steel. The iron of aerolites contains from three to ten per cent. of nickel. Iron with ten per cent. of nickel forms an alloy somewhat malleable and easily broken under the hammer; has a yellow tinge when polished, is very slightly affected by humidity.

**COBALT AND IRON** combine by fusion. It can be both forged and welded; is somewhat brittle when hot, but it is not so when cold. The alloy is magnetic and whiter than pure iron.

**CHROMIUM** has a great affinity for iron and readily forms alloys in all proportions. The compounds are hard, brittle, crystalline, and of a grayish white than iron, and having some luster. An alloy of 0.60 of chromium and 0.40 of iron is whiter than platinum, and so hard as to cut glass, and so brittle that it can be powdered in an agate mortar.

**ARSENIC AND IRON** combine by fusion in any proportions. With a large amount of arsenic the magnetic character of iron disappears. The alloy is more or less white, hard, brittle and fusible, according to the amount of arsenic. One part of arsenic and two parts of iron is of a gray white color, very brittle and more fusible than iron. A very small quantity of arsenic suffices to effect the malleability of iron and renders it brittle when cool. It cannot be welded.

## Weekly Stock Circular.

Of Associated Brokers of the S. F. Stock and Exchange Board.

SAN FRANCISCO, SATURDAY MORNING,  
February 23, 1907.  
MONEY MARKET.

There is now a large amount of idle capital in this city, and the accommodations of bankers and others to merchants are made on very easy terms. For several months past real estate transactions in San Francisco have absorbed a very large share of the surplus money belonging to persons of comparatively small means, and at present no abatement is noticeable in this class of investments. The Savings Banks continue to receive accessions to their already large deposits, and in most instances loans are obtained at 1 per cent. per month from these institutions as well as from most of the other private banks— $1\frac{1}{4}$  to  $1\frac{1}{2}$  per cent. being for the most part outside rates.

During the week under review a small amount of 7-30 Bonds sold in the Board at  $78\frac{3}{4}$  c. Legal Tender Notes rule at  $73\frac{1}{2}$  to  $74$  c. The latest telegraphic advices from New York quote gold at  $136\frac{1}{4}$ , and Sterling at 109.

## CITY STOCKS.

The city share market exhibited little activity during the past week, and the offerings as a general thing were unusually light. The new stock of the Pacific Insurance Company sold at  $117\frac{1}{2}$  per cent., seller 30, and 120 per cent. Fireman's Fund Insurance Company, to the extent of 100 shares, realized  $102\frac{1}{2}$  per cent., and San Francisco Gas sold at \$69 per share, and at the close \$68 $\frac{1}{2}$  is bid. California Steam Navigation Company sold at  $62\frac{1}{2}$  to  $63$  per cent. For Spring Valley Water Company 67 per cent. was asked on the 21st instant. For Union Insurance Company 109 is bid, and for National Insurance Company 73. The receipts of the San Francisco street railroads during the month of January, as obtained from the books of the Revenue Department, were as follows: North Beach and Mission Railroad, \$17,166; Omnibus Railroad, \$18,804; Central Railroad, \$10,607; Front street M. and O. R., \$4,863; Market street Railroad, \$3,595.

## MINING SHARE MARKET.

The mining share market has exhibited considerable life this week, large sales have been made, and for the most part prices have been well sustained. The inclemency of the weather has prevented the receipt of full advices from the mines, but so far as we can learn, no material change has taken place worthy of special note.

HALE & NORCROSS—continues very firmly held, no public sales having been made during the past week; we learn, however, that one foot was privately disposed of at \$3,000. At the close \$2,900 is bid. This mine steadily maintains the excellent reputation it has enjoyed for a year past, and we are informed that at the next annual meeting of the stockholders, to be held in March next, a very flattering report of the condition of the company's affairs will be made.

SAVAGE—sold at fluctuating rates, opening at \$1,900, buyer 3, declining to \$1,800 at \$1,775, recovering to \$1,900, and closing on Thursday at \$1,980, seller 30. During the week ending February 16th, 1,805 tons of ore were taken from the mine, showing an assay value of \$63,509, being an average yield of \$35.18 per ton; the previous week the assay value of the 1,182 tons produced was \$33.62 per ton. The largest proportion of ore continues to be taken from the Curtis shaft—729 tons coming from that point during the week under review, and 673 tons from the seventh station. The second station drift from the Curtis shaft, which is being carried north toward the 7th station in the old works, is said to look well, the deposit of ore being wide and of a good average quality. Most of the Curtis shaft product is taken from this locality. It is also stated that the breasts on the lower station, south mine, look better than for some time past. The Curtis shaft has now been sunk to a depth of 80 feet below the seventh station.

CROWN POINT—rose from \$860 to \$950, then sold at \$880, and closed at \$900. During the week ending the 15th instant, 847 tons of ore were raised; previous week, 897 tons. We learn of no material change in the mine since our last report. Considerable prospecting was done during the first half of the present month without any results of a very encouraging nature; however, the mine gives its usual yield of ore from points heretofore developed. The bullion returns so far this month are said to equal those of a corresponding period in January.

YELLOW JACKET—steadily declined from \$785, the closing price of last week, to \$678 and \$665, then rallied to \$720, and closed on the 21st at \$694. This mine produced 1,854 tons of ore from the 1st to the 11th instant, and the yield of bullion during the same time amounted to \$19,204.64. During the period embraced between the 1st and 14th of the previous month, three days more than the report of the present month, the ore extracted aggregated 2,780 $\frac{1}{2}$  tons, and the bullion returns amounted to \$41,518. If these yields are to be taken as the product of the ore extracted during the several periods, and the statements give us no other explanation, we obtain a fraction over \$10 per ton for the former and \$15 per ton for the latter, certainly a very unremunerative yield. This company during the first half of the present month employed on an average 222 men per day, of which number 93 were extracting ore and 40 were engaged in prospecting.

GOULD & CURRY—has been in little request, selling at \$545 to \$550, receding to \$512.50, and closing at \$520. We have nothing of special interest to report from this mine. We learn that work both at the mill and mine is progressing very favorably, exhibiting judicious and economical management in every department.

CHOLLAR-POTOSI—was dealt in to a large extent at enhanced rates, advancing from \$225 to \$240, receding to \$233, improving to \$246, and closing at \$250 seller 15. During the week ending Feb. 16th, 1,140 tons of ore were sent to custom mills, being 80 tons more than in the previous week. The ore, in going south on the Blue Wing station, is said to be of good quality and some 18 feet wide, and the developments below this station continue to look well. The north winze on the first station of the new shaft is down 20 feet, and an average assay of the ore shows \$150 to the ton. In the third station, new shaft, which is 720 feet from the surface, the east clay wall has been reached.

OPHIR—has been in favor at an advance, selling within a range of \$180 to \$200, and closing at \$220 seller 30. IMPERIAL—advanced from \$170 to \$185, and on Thursday \$185 per share was bid. The receipts of bullion by this company up to the 17th instant amounted to about \$32,000. The dump at the Alta mine is full and the ore shows an improvement in quality. A large supply of ore remains on hand at both mills.

EMPIRE—has been more freely dealt in, advancing from \$180 to \$190, and closing at \$187.50 seller 30. BELCHER—sold at \$120, then at \$117.50, and closed at \$112.50. BULLION—receded from \$19 to \$13, and at the close sold at \$17. CONFIDENCE—varied little from \$18 per share, closing at \$17. OVERMAN—is exceedingly quiet; sold at \$16.50 during the week. DANBY—sold to a considerable extent at \$8 to \$5, closing at \$5.50 seller 30, and a few feet of SIERRA NEVADA at \$3.50. An assessment of \$4 per share was levied on the latter on the 15th instant.

The aggregate sales of Stocks, Legal Tender Notes, etc., since Saturday last, amounted to \$819,005.

PACIFIC HYGIENIC HOME WATER CURE, at Fountain Farm, near Oakland. Chartered and conducted according to the teachings of the Hydropathic College of New York, by the Pacific Hygienic Home Association (Incorporated). B. J. SMITH, M. D., Consulting Physician; R. S. MACBETH, M. D., Attending Physician; W. G. W. HAARFORD, Manager; H. ANDREWS, Business Agent. Office, Baths and Lecture Hall, No. 627 Sacramento street, between Montgomery and Kearny streets. Free Lectures every Tuesday and Friday evenings. 16v13-1f

OLNEY & Co., Auctioneers and Real Estate Agents, attend promptly to all business entrusted to their care in San Francisco and Oakland. Mining and other corporations will find Col. Olney well posted and thorough in transacting sales of delinquent stock. Office, on Broadway, Oakland, and No. 318 Montgomery street, San Francisco. nolo

NATURAL CURIOSITIES FOR CHRISTMAS.—At No. 522 Pine street, E. F. LORINCIN, the Naturalist, has on hand a beautiful assortment of glass globes full of Stuffed Birds, Shells, and Wax Flowers, besides Feathered, Birds and Butterflies, for ladies' hats, Shells, Sea-weeds, etc. 24v13-qr

Air Pump for Sale.—One of Tate's Double-Action Air Pumps, in prime order, can be had at a bargain, by applying soon at this office, or to JOHN ROACH, mathematical instrument maker, 523 Montgomery street. 21v13-3p

**CENTRAL CITY, COLORADO.**  
19v12-ly

EUROPEAN  
METALLURGICAL WORKS,

**Practical Mining School,**  
Bryant Street, Between Third and Fourth,  
SAN FRANCISCO.

THE Proprietors are at all times prepared to work or test Ores sent to this establishment—either in large or small quantities—by such process as may be found best adapted to their chemical character, after a careful analysis has been made. Test lots of Ore adapted to the smelting process attended to. Sulphur, pyrites, and the (so-called) "rebellious ores," are having especial attention paid to their successful treatment. Assaying in the humid and dry way. Also, refining by cupellation, done at moderate rates.

## PRACTICAL MINING SCHOOL.

The proprietors—encouraged by numerous applications from gentlemen desirous of pursuing the study of practical metallurgy—have concluded to admit parties on reasonable terms. Having in their Mill all the necessary appliances for crushing, roasting, amalgamating, smelting, refining and assaying, as also a well extended Laboratory for the analysis of Ores and Minerals, a good opportunity is here offered to acquire a sound practical knowledge of the business.

**S. P. KIMBALL, J. R. MURPHY,**  
10v10

MOSHEIMER'S  
Metallurgic Works

And Practical School for Assaying and Metallurgy.

THE UNDERSIGNED HAS REOPENED METALLURGIC Works, and is prepared to reduce any kind of Ores, by Smelting, Amalgamating, or other processes, that the nature of the ore may require.

Practical Instructions given in Assaying, all branches of Metallurgy and Technology.  
Furnishes Plans and Estimates for the erection of Quartz Mills, Smelting and other Reduction Works.

Having carefully studied the science of Concentrating Ores, I can offer better concentrating machinery than any in use in California, and especially such as will save the fine or floating gold and sulphurets.

**CONSULTATION OFFICE:**  
328 Montgomery street, San Francisco.  
J. MOSHEIMER,  
Engineer and Metallurgist.

26v13-3m

GOVERNMENT HOUSE,  
Corner of Sansome and Washington sts.,  
SAN FRANCISCO, CAL.

THE STREET CARS PASS THIS HOUSE IN every direction, every ten minutes.  
The rooms of the House are well furnished, large and airy, are let by the month, week or day, and are kept in superb order. There is a Restaurant attached for ladies and families, where persons can board for one-half day they are required to pay at hotels.

17v13-6m SANBORN & CO.

## PATENT BUSINESS.

We have lately associated with us in the Patent and Mechanical Department of the Mining and Scientific Press, a gentleman of superior ability and attainments, who has arrived direct from the leading patent agency in New York city, and having a faithful and reliable associate in Washington City, we are now better than ever before prepared to secure the claims of our applicants, in a careful, prompt and efficient manner.

**DEWEY & CO.,**  
San Francisco, Jan. 1867. Patent Solicitors.

**Important to Californians.**—Many inventors have lately had their claims for Patents seriously and in some cases fatally delayed by the unqualification of agents who have not complied with the Government license and revenue laws, as well as other new and imperative regulations. These discrepancies, although arising from the inexperience of honest agents, are none the less dangerous to applicants for patents, whose safest course is to trust their business with none but active and experienced solicitors. THE MINING AND SCIENTIFIC PRESS PATENT AGENCY has strictly complied with the regulations of the Department, and properly filed all necessary papers as Claim Agents.

## To Those Whose Interests We Represent.

While there is every reason for gratification at the circulation which this journal has already reached, we are yet well aware that there are great numbers of miners, mechanics and lovers of science to whom it might be made a source of much usefulness and profit. We feel no hesitation or modesty in urging the claims of the paper upon the attention of all for whose especial benefit its publication is intended. Being the only journal of the kind this side of the Rocky Mountains, and having a wide circulation distributed throughout all the States and Territories on the Pacific coast, and among the most intelligent and thriving portion of our people, it presents a new and valuable medium for advertising—a feature which our columns show for themselves, is quite generally appreciated.

New subscriptions will be received at all times by mail or otherwise. Those who have friends that they think might be interested or benefited by the paper, will confer a favor both upon them and us by calling their attention to this matter, and at this time. By so doing they will place us under still greater obligations to themselves, and enable us by its increased receipts, to add still more to the value of the paper. It is thus that in the growing welfare of the country and people, this journal hopes to find its due share of prosperity, and a fair reward for its efforts in behalf of science, of industry and of progress.

We trust that it is needless to urge upon our readers the necessity of promptly renewing their subscriptions. The two indexes for volumes XII and XIII, which we have already published, and the 500 ample pages of reading matter, apart from advertisements, to say nothing of our numerous engravings and illustrations, speak more for the value which we give for the price of a year's subscription than we can say in this connection. For the next year we can safely promise even more. Increased experience and enlarged means and facilities will secure this. Everything that untiring industry and reasonable expense can accomplish, will be done to render the MINING AND SCIENTIFIC PRESS a journal which shall be creditable to the interests which it represents, and of special value to its readers.

Jan. 1, 1867.

Pacific Mail Steamship Co's  
THROUGH LINE TO NEW YORK,

Carrying the United States Mail.

LEAVE FOLSOM STREET WHARF, AT 11 o'clock A. M. of the following dates, for PANAMA, connecting via Panama Railroad, with one of the Company's splendid steamers for ASPINWALL for NEW YORK.

On the 10th, 15th and 30th of each month that has 30 days.

On the 10th, 15th and 30th of each month that has 31 days.

When the 10th, 15th and 30th fall on Sunday, they will leave on Saturday preceding; when the 18th falls on Sunday, they will leave on Monday following.

Steamer leaving San Francisco on the 10th touches at Manzanillo, All touch at Acapulco.

Departures of 15th or 19th connect with French Transatlantic Co. steamer for St. Nazaire, and English steamer for South America.

Departure of 10th connects with English steamer for Southampton, and P. R. R. Co's steamer for Central America.

The following Steamships will be dispatched on dates given below:

February 24th—MONTANA. Capt. Jos. Sulton, Connecting with the RISING STAR, Capt. Furber.

Cabin passengers berthed through. Baggage checked through—100 pounds allowed each adult.  
An experienced Surgeon on board. Medicine and attendance free.

These steamers will positively call at 11 o'clock. Passengers are requested to have their baggage on board before 10 o'clock.

SAN FRANCISCO, CAL.

THIS OLD ESTABLISHED HOUSE IS IN PERFECT order for the accommodation of guests. Persons seeking comfort and economy will find this the best Hotel in the city to stay at. The Beds are superb and in good order, and the Rooms well ventilated. The Table will always be supplied with the best in the market.

Prices vary from \$1.50 to \$2 per day for Board and Room.  
FINE BATH HOUSE AND BARBER SHOP ATTACHED TO THE HOUSE.  
Rooms belonging to the House will be in attendance at all the boats and cars to convey passengers to the House FREE OF CHARGE, and to any part of the city for 50 cents.  
21v12 F. E. WEYGANT, Proprietor.

**Postage.**—The postage on the MINING AND SCIENTIFIC Press to any portion of the United States is twenty cents per copy, or five cents per quarter, payable in advance at the Post Office delivering the paper. Postage free in the city and county. Foreign postage (with few exceptions) two cents per copy, prepaid. To Bremen and the German States (excepted) via Bremen and Hamburg line, three cents per copy, prepaid. Single copies to any address in the United States twenty cents.

## Mining Summary.

The following information is gleaned mostly from journals published in the interior, in close proximity to the mines mentioned.

## CALIFORNIA.

## Alpine County.

From the *Miner* of Feb. 16th: Nothing definite is known here as to what the Morning Star Company will do, but it is thought that the next operation will be to smelt the ore, the works to be erected at Mogul.

The Tarshish tunnel is now in 490 feet, and well timbered.

J. P. Ray has commenced work on the Mountain lode. He will sink next the east wall, where is found a soft gouge easy to work, and when sufficient depth is attained, cut across the lode and test its value.

The Alpine mill worked this week, some Mowyer ore. After being crushed, the ore was slightly roasted in a Freiburg barrel, and produced \$21 per ton, chiefly silver. Ore from the Leviathan, worked in the same way, is not yet cleaned up. Two pounds of the pulp, however, was worked by hot power process, with one pound of quick-silver, and the result was a ball of amalgam weighing thirteen ounces, avoirdupois.

## Amador County.

From the *Ledger* of February 16th: The Atchison mill will soon be ready for operating. The batteries are completed. The Kendall mill is soon again to be put in operation.

The Meader sulphuret mill at Sutter will soon be at work. It will contain ten grinders and forty-eight pans.

At Pine Grove and Volcano the mills are profitably engaged. The owners of the Anaconda are getting fifty tons of ore crushed at the Paugh mill. The Anaconda boys have the richest rock we have seen for many a day. They are putting up a whim. Crafts is having a lot of his rock worked at Thoss' mill. The Paugh mill was started up on Monday. His ore continues rich. The Union mill is being repaired, and a contract let for sinking a shaft thirty feet deeper. We understand that important changes will be made at the Coney mill. The Sutter Creek, Amador and Drytown mills are as active as ever. A Chileno picked up a piece of quartz near Union mine at Pine Grove that yielded over \$220. Frank McBride is now taking out rich rock from the new discovery, between Grass Valley and Volcano. His claim is adjoining the Crafts mine. The Tellurium will commence operations again next month.

The Kearsing Mill, with Ambler's sulphuret apparatus, is now working the rock taken from the Blue Jacket mine. This mine is on the same ledge, and adjoining the Coney & Bigelow claim. They are now down nearly ninety feet, and the rock is pronounced as good as that taken from the former mine.

The Golden Eagle mine, owned by Vaughn & Co., near Pine Grove, was sold last week for the sum of \$25,000.

The Italian mine on Else Creek, owned by Sorocco Bros., and McLaine, is being worked night and day. They are now hoisting rock from a depth of three hundred feet, and in handsome paying quantities. At the mine, they use an engine, while their mill is propelled by water power.

## Calaveras County.

From the *Chronicle* of Feb. 16th: Alexander, Seavers & Co., of the Pamona lead, in old Rich Gulch, have purchased the 10-stamp battery formerly owned by the American Shaft Company, and are engaged in removing it to their mill in process of erection. The motive power will be one of the Tyler water-wheels. The mill will be ready to commence crushing in March.

From Middle Bar district, news continues favorable. Grimm & Co. are obtaining fine prospects. The ledge is sixteen feet in width, five feet of which is remarkably rich. The entire lead will average \$25 per ton. Stewart & Co. have one of the most promising veins in the district.

A good custom mill is wanted here. No better investment could be made.

From Rich Gulch and El Dorado districts we have cheering reports. Bever & Co. and Gleason & Co., at Rich Gulch, are pushing forward work with energy. Howell & Co. have completed their bedrock flume. The mining interests of Calaveras were never in a more flourishing condition than at present, and there will be more gold dust shipped from this county the coming season, than for a number of years previous.

West Point correspondence of the same: The old Carson lode is leased for two years to McCarty & Timbony on shares. They have two shafts of fifty and seventy-five feet, and a tunnel of 350 feet. The rock will pay \$50 per ton. . . . The Goldstein mine is yielding very rich rock. . . . John Johnson's mine

is immensely rich. . . . Mr. D. Hare has struck a good mine on Bear Creek. He has some ten tons of good rock out, which he expects will pay at least \$50 per ton.

The San Andreas *Register* of Feb. 16th, says that Burnett & Paine have a placer claim near the Hawkeye, that for extent and richness, beats the world. It is believed there is rich "pay dirt" enough exposed to the eye to give employment to twenty men for as many years.

## El Dorado County.

Correspondence of the *Democrat*, of Feb. 16th, says: "The Hermitage claim at El Dorado is being thoroughly worked. On Monday last they threw out at one blast what I should consider \$5,000. The rock looked beautiful, and in some of the pieces it was hard to tell whether the gold or quartz predominated. The main shaft is down about 190 feet, but the place where the present strike is made is not more than 90 feet from the surface. The Company have a fine 40 stamp mill, at a cost of \$18,000. The Union mine, now called the Church Union Gold Mining Company, have purchased from C. P. Jackson, the old Central at Loafer's Hollow, for \$10,000 cash, and a road has been completed from the mine to the mill, about one mile. The rock is of a superior quality. Gold can be seen in almost every piece. Smith & Co. have taken a contract to run a tunnel 120 feet to strike the main ledge. They have 90 feet finished, and expect to complete the job by the 20th inst. Van Tassel & Jamison have been compelled to suspend operations on their shaft at Aurora, owing to the water. If the present weather continues, they will resume work in a few days."

From the *Courier* of Feb. 16th: The shaft on the Gillingwater claim at Poverty Point, is down over 100 feet. The ledge is 8½ feet wide, and the rock averages \$35 to the ton. . . . Shepard & Hill have a tunnel only 30 feet in, yet so rich is the rock, that they have taken out in four months money enough to build them such a mill as they need for present use. Their tunnel, thus far, has been through decomposed quartz and talc, forming itself into a solid ledge as work progresses. The rock is very rich, the sulphurets alone assaying one hundred dollars to the ton. . . . The claim of Powers & Co. also prospects richly. Prospectors can be seen, with pick, shovel and pan, leaving the city at an early hour every morning, to spend the day in search of quartz, gravel and cement beds, returning in the evening, seldom failing to bring rich specimens.

## Kern County.

From the *Havilah Courier* of February 9th: The Live Oak mine is now well opened. Several thousand tons of ore are in sight, which prospect well. The mill will be in operation in the course of the next thirty days.

## Mariposa County.

From the *Gazette* of February 16th: We have received some very fine specimens of gold-bearing quartz rock from the Romo mine, on Bar Creek, about two miles from Colorado. The size of the ledge ranges from one to six feet, averaging about three and a half feet all through.

Owing to an injunction served upon Mr. Potts, the enterprising lessee of the Princeton mine, work has been suspended for a time. In the last three and a half days previous to the suspension of the work, about twenty-three tons were crushed, which yielded \$3,600.

## Nevada County.

From the *Transcript* of February 15th: The owners of the Manzanita Cement claim are making fifty dollars per day above expenses with their 15-stamp mill. Gravel or cement which will pay one dollar and a half per ton is found to be profitably worked. . . . Fourteen tons of quartz from Rock Creek, worked at Palmer's mill, yielded forty dollars to the ton. The ledge is owned by S. B. Davenport and others of this city.

Same of 19th: The Nebraska claims, better known as the "Dutch Diggings," about two miles above Quaker Hill, are paying one hundred dollars per day this season.

From the *Gazette* of 14th: Pearl Ladd has recently sold his hydraulic claims at Rough and Ready, to a company of Portuguese from Forbestown, for \$8,000. Ladd refused eleven thousand dollars for the claim some months ago, but his flume was blown down by the cyclone of December 27th.

Same of 15th: The Wisconsin company have leased their mine to parties who have been employed in working it, for the period of three years. The lessees pay to the owners two-fifths of the gross proceeds. The mine is near the French lead, below Grass Valley, and we are informed has yielded 1,600 tons of rock, the poorest of which paid \$48 and the best \$68 per ton.

Same of 17th: In the Surprise mine, on Massachusetts Hill, a shaft has been sunk to a depth of one hundred feet, and also an air

shaft connecting with the level. At this depth they have struck a ledge varying in width from eight to fourteen inches. During the present season they have had three crushings from this mine, which have yielded respectively \$22, \$25 and \$28 to the ton. There are now some twenty tons of rock on the surface awaiting crushing.

Letter from San Juan North to the *North Californian* of Feb. 14th, has these items: The famous Eureka claim, that in other days paid so enormously at each clean-up, is hardly paying expenses. The Golden Gate has not equaled expectations, and although it is paying its stockholders a handsome dividend, yet it is not making them rich very rapidly. The celebrated American claim, at Manzanita Hill, yields at each clean up of from two to four weeks' run, from ten thousand to seventeen thousand dollars. Here, also, are several other claims that are paying well. Farther down the ridge, at Burchville and French Corral, the mines are reaping rich harvests.

Several quartz ledges have been recently discovered in the neighborhood of North San Juan, the croppings of which prospect well, but as yet no effort has been made to construct mills or to ascertain their extent and richness.

EXCELSIOR.—From the *Meadow Lake Sun* of Feb. 16th: The Golden Eagle 5-stamp mill was put in operation about ten days since. The Grant mill has been running regularly all winter, receiving its supply of rock from a partially opened mine one-half mile distant.

The Light-Foot company are now delivering rock at the Winton mill, hauling it one mile.

The Mohawk company are now getting in the final portions of their machinery from Cisco. The custom mill is now nearly completed. The Gold Run company have worked regularly during the entire winter.

Work upon the California company's shaft has been prosecuted night and day, and a depth of eighty feet has been attained. Nothing more need be added to prove the practicability of mining at Meadow Lake without cessation during the entire year.

## Placer County.

From the *Stars & Stripes* of Feb. 13th: A couple of boys were chasing a lot of stock up the ravine, a few days ago, and were pelted them with pebbles and stones which they would pick up on the side of the ravine, when the attention of one of the boys was attracted by the unusual weight of one of the stones thus picked up, which, on examination, proved to be a nugget of gold, weighing about 10¼ ounces, and worth about one hundred and twenty-eight dollars.

## Plumas County.

From the *National* of Feb. 9th: We are informed that placer mines of great value have been discovered near the site of the old Buckeye mill, between Round Valley and Greenville—prospecting as high as one dollar to the pan. Considerable excitement has been occasioned in the vicinity by the discovery, and numerous locations have been made.

From the *Quincy Union* of same date: Underwood & Co., who have been prospecting at Dutch Hill for some time past, have struck the lead and found very rich diggings. The old Cummings claims are still paying enormously.

On Monday last new diggings were struck in the hill on the west side of North Cañon, between Greenville and Round Valley. Some of the dirt prospects as high as \$1 to the pan. The whole hillside for a mile, has been staked off and claims located.

John Parrott & Co., of San Francisco, are now the owners of the Eureka mine and ledge in this county. Last year they worked the mine, employing only about eighteen men, and made a profit of \$10,000 for the season's work.

## Shasta County.

From the *Courier* of Feb. 16th: Last week, Col. Waish shipped seven tons of Chicago ore to San Francisco, for the purpose of having it worked. Heavier shipments will be made as soon as the roads from South Fork and Red Bluff become passable.

The last run made by the Washington mill, at French Gulch, yielded \$2,255.

Peck and Tiffin, whom we spoke of as having gone on a prospecting expedition to the head of Mad Ox Creek, have returned and reported finding some rich gold quartz, but think the ledges are too small to pay for working.

## Sierra County.

From the *Downieville Messenger* of Feb. 16th: The New York claims, at Sawpit are reported as paying big dividends.

The Union, at Gibsonville, has been paying, it is reported, about an ounce a day to the hand for some time past.

The North American and Nevada claims

at Newark are said to be steadily paying about six or eight dollars per day to the hand.

Letter to same from Downieville: The American Company is working twenty-five men, all day hands. Their ground looks well. The claim is in the best of condition. The claims of Parish & Co., McGee & Co., will be started on the first rush of water, and with all the men we can work this coming spring, this will be a lively camp.

## Siskiyou County.

From the *Yreka Union* of Feb. 9th: Mr. Henry Truett, of the Shasta Butte Quartz Co., a few days ago discovered another quartz vein on the middle fork of Humburg creek. The vein is about two and one half inches in width on the surface. Our informant says it is the richest quartz yet found on the creek.

The Mary and Eliza Quartz Co., on Humburg, are running a tunnel into the hill, and expect to strike the vein near the water level. They have taken out about fifteen tons of quartz on the surface, which we are told is fine looking rock.

Rich rock is now coming out of the Mexican mine. It is peculiar, and several tons of it had been thrown aside, before it was discovered to be good. Three pans of it yielded two dollars.

## Trinity County.

From the *Journal* of Feb. 9th: Within the past few months we have received information from several reliable parties that good paying placer diggings had been found in the extensive scope of country lying between Hay Fork Valley and the South Fork of Trinity river, as well as on that stream and its tributaries. We give an extract from a Humboldt county letter: "Placer diggings are known to exist on several streams that empty into the Trinity along that space where the river is the boundary between your county and ours. These streams are Willow Creek, Indian Creek, Grouse Creek and Madison Creek. Ours is not a mining population, and consequently but little has been done towards prospecting those sections. An old practical miner (now a soldier) who has been stationed at Fort Gaston and Inqua, assures me that good \$10 diggings have been found, and that miners are actually making that amount. He further tells me that miners have purchased goods at Arcata, for which they made payment in gold dust, and that they had an abundance of it."

## Tulare County.

From the *Times* of Feb. 9th: We have seen some quartz from Antelope Valley that looks well, and is said to be rich. This discovery is in the hands of enterprising men, and we understand they intend to open and fully develop it. This valley is but eighteen miles from Visalia.

## Tuolumne County.

From the *Columbia Citizen* of Feb. 16th: In Corral Gulch, W. A. Hanson is running a cut, one thousand feet long, for the purpose of working a claim that paid on the surface, three years ago, \$400 per week.

## Yuba County.

From the *Appeal* of Feb. 19th: Brown's Valley is to become a second Grass Valley. We understand that the Donnebrogue, Yuba and Sweet Vengeance will resume operations on the 1st proximo; also, that work will commence on the Dan Webster.

From the *Grass Valley National* of Feb. 15th: At Timbuctoo, the great blue gravel lead is panning out as lively as ever. The Union claim finished their new flume a few weeks ago at a cost of \$11,000. It is three feet wide and two feet perpendicular, the boxes being twelve feet long, and of course lined, as usual, with blocks. The Union Company took out of the last eight boxes alone, a short time ago, \$500 in gold, and from the "under-current," fifteen ounces. The Antoinette Company cleaned up, the other day, from nine days run, \$8,000.

## ARIZONA.

From the *Miner* of Jan. 26th: Under the superintendence of Charles L. Strong, a very fine quartz mill has been erected at Hardyville for the reduction of the quartz from the Moss lode, which promises rich results.

The persistent prospecting upon the several mines at the head of Silver Creek, by W. H. Hardy, is producing great confidence in the value of the mines now being opened. From the Sacramento district, adjoining, we hear flattering accounts, notwithstanding the late Indian murder of several miners.

## COLORADO.

From the *Times* of January 29th: From a cord of quartz, taken at a depth of twenty-five feet from the Chemung lode, Lake Gulch district, Messrs. Ewers & Stocks realized nineteen ounces and three pennyweights of gold, which, at \$16 (coin) per ounce, is worth \$305.40.

Indications at present denote a lively

mining season in Gilpin and Clear Creek counties in the spring.

An assay was lately made at Denver from silver ore brought from the Ground Sluice lode, Red Mountain district, and the result was a nine dollar button, which was equal to \$2,600 to the ton. This ore was from a depth of only twelve feet.

The Smith & Parmelee, Black Hawk and Selsenderfer companies retorted, respectively, 175, 91 and 185 ounces, last week, some of them from only a four and five days' run.

In Ward district the Ni Wott company are replacing their burned down mill with a new 50-stamper, which will very soon be prepared to "pond away." Bigby's six-stamper is busy, and Cushman's crusher soon will be. A Crosby & Thompson 21-stamp mill is crushing from the Stoughton lode, and the Pomeroy company's 20-stamper is preparing to pond.

The "Beldou & Tennial Mining Company of Colorado" was recently organized in New York. They own several well known lodes in Russell and other districts.

There is one shaft on the "R. P. Ranney" lode 100 feet deep, and another 30 feet deep, both well timbered. On the Black Quartz lode there are several shafts down to the crevice, and one to the depth of about fifty feet. This last exposed at the bottom a large crevice of rich quartz.

From the Denver News of January 30th: In Sugar Loaf district, but little has been done except by the Colorado Mining and Exploring company. On the North Star a shaft has been sunk eighty feet. The crevice is from two to five feet wide, with a pay streak of from eighteen to twenty inches thick. About eight cords of ore are now on the surface, which, it is estimated, will produce three thousand dollars. Two other lodes, within forty rods of the North Star, have been tested to some extent. The Saturn has a shaft twenty-five feet deep on the Discovery, with a pay streak three feet wide. On the Topeka a tunnel has been driven forty feet, showing a fine crevice four feet wide. On the Black Jack the discovery hole was sunk forty feet, when a drift of eighteen feet was made on the hole.

In Bald Mountain district, Wilson Edson and Fowler are the only ones that appear to be doing anything. They will erect machinery in the spring. About twelve cords of top ore have been taken out of the various lodes, estimated, from sampling in the pan, to be capable of producing from \$5,000 to \$6,000 in gold.

From the Register: Mr. Harris, from Georgetown, yesterday gave us the result of an assay of ore from the Bethany lode, which was \$22,137.30, in silver, to the ton. The ore was not more than three feet from the surface. Several buttons of silver were also exhibited from the Vermont and Nuckolls lodes. The Nuckolls lode is being worked by the Washington company, two tons of ore being taken out every day.

#### IDAHO.

From the Owyhee Avalanche of Feb. 9th: The Cosmos Company is making the necessary preparations to start up the mill. Another week's labor about the mine and mill will put everything in order. We have outside information from New York that the financial affairs of the company will soon be adjusted.

The Dashaway ledge presents fair prospects. A shaft to the depth of fifty-five feet has been sunk this winter. At the bottom, the ledge is twenty inches wide with solid casings.

The first extension north of the Poorman, which was sold in New York, will be opened in April.

The Woodstock ledge is reported as making a most satisfactory showing at the bottom of the shaft—two and a half feet wide and richer than ever.

The Vulcan ledge is being worked. Informed that it looks as well as ever, and that much good quartz is piling up at the works.

The New York and Owyhee Company will at once commence work in their lower tunnel, on the Hays & Ray ledge. There remains 400 feet to be run to reach the original shaft on the Poorman.

A sample of ore from the Sherman ledge in Flint district, assayed last week, \$4,944 per ton.

From the Lewiston Journal of Jan. 24th: Mr. Gilbert, who came in from the Gnat Creek mines on Monday, reports about eighteen men at work there, making from three to five dollars per day per man. There is about eighteen inches of snow in the mines. They have some timber to remove in mining. The stripping is about two feet deep, and the pay gravel averages about eighteen inches. The gold is fine and is worth about \$18 per ounce.

Two miners came in town on Tuesday from the bars of Salmon river, about ten miles above its mouth. They report about

twenty-five men at work in that vicinity, mining. The average per day per man is about three dollars, including the time occupied in clearing away and stripping. In some places they are working high bars, with about eight feet of stripping and from six to eight inches of pay gravel underneath. The pay dirt is a kind of gravelly clay or cement which requires puddling to extract the gold.

#### MONTANA.

From the Post of Jan. 26th: The Postlewait mill commenced operations a week ago. It is one of Hendy's improved, and has fifteen stamps. The machinery runs as smoothly as clock-work. The first run was six days and a few hours, and the clean-up \$1,103. It is estimated that not over two-thirds of the gold was saved, owing to a defect in the housing around the batteries, which let some six pounds of quicksilver escape, but this will be remedied at once, and a portion of it will yet be recovered in the blankets. They have some 500 or 600 tons of rock taken out, and they will be kept constantly at work.

Wright & Co., who have been sinking a shaft in the gulch opposite Oregon City, have struck bedrock at a depth of sixty feet, and are taking out big pay. Some three other companies are running drain ditches preparatory to sinking to the bedrock; and all the indications favor a lively time next summer. Ground in the gulch is held high, and bar claims are being worked with fair returns.

Quite a number of claims are recorded in Rabbit district. By August next, the hills around will echo the sound of many stamps. Rochester Gulch is highly spoken of by old miners.

In New York Gulch, Mr. Hendrie's 24-stamp mill, last Monday started up on quartz from the Esta lode, with every prospect of success. Simpson & Co.'s 30-stamp steam mill will shortly commence operations. Considerable sales have of late been made in that section. One in Philadelphia comprising one-half of six ledges, (6,000 feet) for \$90,000, or at the rate of \$90 per foot. Major Cullen & Co. are preparing their mill-site for machinery, which they have already ordered. An agent for a Chicago company is also looking around, and is evidently anxious to invest. Work on the various lodes is progressing finely, and everything looks fair for an active campaign during the next year.

The main shaft of Prof. Hodge's mill is broken. The delay will cause serious loss.

Eight thousand two hundred dollars was the amount cleaned up last week, in the Turnley mill, from Whitlatch Union ore.

In the Sterling lode, Mr. Cope recently ran a side cut fifteen or twenty feet from the main tunnel, and "struck it heavy." The vein is now perfect; the crevice having a well-defined wall-rock and fully five feet of splendid quartz. The town is growing up rapidly.

Letter to same from Summit, dated July 18th, says: The Lucas mill, a 24-stamper, is pounding away with twelve stamps. A new engine is to be put in, capable of running the whole number. The last run of six days proved very satisfactory, so much so that the company this week purchased the claim of 100 feet from which they are crushing, for the sum of \$30,000. The shaft is eighty-five feet deep. . . . Nearly opposite the Lucas, on the west side of the gulch, Messrs. Mesler & Co. are running a tunnel. It is now 190 feet long. They propose striking the Butler lode, 180 feet below the surface. The rock is very hard and every foot must be blasted. Lower down the gulch another company are also driving a tunnel to strike the Kearsarge, 190 feet below the surface. . . . The New York Company, which purchased the Seneca Falls mill, intend putting up a new 30-stamp mill, in the spring. . . . Ezekiel & Johns are running a tunnel on the Mechanic lode that prospects well. On account of the snow they will not crush from it before spring.

Letter to same from Bannack: There are now five companies operating here and two at Argenta. The Dacotah No. 6 is an entire success, but the Butterfield does not contain the requisite machinery for saving over one-fourth of the precious metal. Every available place in the vicinity of the mill is now filled up with tailings, which will at no distant day yield a fortune. Dr. Hopkins has gone East to purchase the necessary machinery, which will be forwarded early next season. . . . In the Huron, the mineral is rich, and the crevice now two feet wide. Smelting will be commenced in the spring. . . . The mill of the New Jersey Company is now running like a top.

From Red Mountain: Very rich and extensive placer mines have just been discovered high up on the mountains, immediately below the belt of rich quartz ledges that crop

out distinctly for a distance of over three miles.

Among the richest quartz leads in this section may be mentioned the Ballarat, Golconda, Nevins and Red Mountain. On the former, two tunnels are being run to strike them at a depth varying from 100 to 250 feet. On the latter, two shafts are being put down. The ledges vary from five to sixteen feet in width, and are of great richness. From four pounds of rock taken from the Nevins, \$4.20 was obtained by crushing and panning out, without the aid of quicksilver. Rock taken from the Golconda and Ballarat will average ten cents per pound.

#### NEVADA.

##### Black Rock.

From the Nevada Gazette of Feb. 14th: Capt. Frank Coffey has lately returned from Black Rock. He has great confidence in the richness and permanency of the silver mines of that country, and intends to return in a short time. The Evans mill will be again started up in the spring. The ore is of a spongy character, reddish color, and unlike any other silver ore of the coast. Some assayers have pronounced it fabulously rich, while others have been unable to find any traces of silver in it. Some of the ore has been reduced at a mill in Washoe and yielded good returns.

##### Esmeralda.

From the Union of Feb. 9th: The Juniata mine is now paying and promises to become one of the most permanent and lucrative mines in this section. The fault heretofore has not been so much the lack of mineral in the ore as the want of proper management in the amalgamating department. The last run of ten days, in which about 170 tons were worked, paid some \$22 per ton, which will leave a net profit of from \$7 to \$9 per ton. The rock worked was not all of the best quality.

##### Humboldt.

From the Register of Feb. 9th: On the Golconda ledge, they are down seventy-five feet. The ledge is increasing in width, and the ore improving. . . . The Sheba mill is running on Yo Semite ore.

Oreana continues to wear an active and thriving appearance—furnaces going day and night rolling out the silver. A large building is being erected to inclose the company's works.

In Santa Clara district, McBeth & Melander are working the Little Giant. Everything looks favorable. The ledge has increased about fourteen inches in width within the last week in the tunnel. They are now taking out good ore.

The Elmira Company is progressing rapidly with its tunnel and main shaft on the North Star mine. Five tons of fine ore has just arrived from this mine at the Pioneer mill, for reduction.

The Washington Company are in 100 feet and expect to continue 800 feet further before they cut the main vein.

The Commonwealth Company will reach the Barker ledge in about sixty feet from where they are now at work.

##### Pahranaagat.

The Virginia City Trespass of Feb. 16th, says: Judge Lawrence, late Special Postal Agent, just from Pahranaagat, gives us these items: Rock from the Sebastopol ledge assayed 10,084 grains silver to the ounce, or at the rate of \$796.38 to the ton. Another ledge, the Waukenah, assays 4.54 grains silver to the ounce, or \$358.54 to the ton.

##### Reese River.

From the Reveille of Feb. 9th: Seventeen tons of ore from the Taylor & Passmore location in the Nevada Giant, Cortez district, arrived this afternoon. Several lots also from Hot Creek and Reveille.

Ten tons of chloride ore from the Vineyard mine, near Yankee Blade, yielded \$98 per ton. . . . Gen. Wild, of the Diana, has leased the Silver Hill mill.

The Gilligan mine, Egan Cañon, has been opened by an incline to the depth of 450 feet. The ore yielded \$200 per ton. The vein is four feet thick.

In Mammoth district, the sinking of the main shaft of the Mount Vernon Company is temporarily stopped by the great volume of water. . . . The shaft on the American Flag is down 130 feet. The ledge is twelve feet in width. . . . The Uncle Sam ledge is two feet thick.

From same of 11th: A shaft, fifteen feet by five, is to be sunk to the depth of 1,000 feet, by the New York and Austin Company, on Lander Hill. Major Sherman, the superintendent, estimates that it will take three years. There seems to be a growing disposition to resume work in earnest on the mines in the neighborhood of Austin. . . . The Confidence mill, of ten stamps, located at Yankee Blade, has been purchased by the La Plata Silver Mining Company, and will be immediately removed to Park Cañon in the North Twin River district. This com-

pany has a vein forty feet in width. Fifty tons of the ore worked \$90 per ton.

Same of 13th: Five bars of bullion, worth \$4,500 came in from Buel's mill last night. It is from Highbridge ore. . . . Fourteen bars, worth \$13,114, came in from the Murphy mine, of the Twin River Company.

Same of 15th: From present appearances the heaviest shipment of bullion ever made from this district will be that for the present month. The Timoke, the Florida, the Great Eastern, the North Star, the Magnolia and the California, have been yielding ore of fine grade. That from the North Star works \$300 per ton.

##### Washoe.

[In the Stock Circular, in another portion of this paper, will be found late mining news from this district.]

From the Territorial Enterprise of Feb. 12th: Another outburst of water has occurred in the Cole tunnel. The track was again torn up for some distance. At last accounts, the amount of water had decreased to twenty inches.

Silver-bearing quartz has been struck within eighteen miles of Mill Creek, on the west side of the mountains lying east of Surprise Valley. Ore from one of the leads yielded by mill process \$57.25 per ton. These mines are on the direct road to High Rock, Black Rock and Star City.

Same of 13th: In the Mont Blanc mine, the tunnel is in 575 feet, and in the course of another 100 feet, will cut the ledge at a depth of 250 feet.

Same of 16th: The new shaft of the Hale & Norcross Company is now 100 feet deep. . . . The dump of the Chollar-Potosi is full to overflowing. . . . The Savage engine is of 300-horse power, is beautifully finished, and is well worth visiting.

Same of 17th: A new pump-bob is being put in place at the main shaft of the Ophir and Mexican mine, in order to lower the pump and sink the main shaft to a greater depth. A drift is now being run at the depth of 630 feet for the purpose of opening a new level. This new drift will tap the lead at a much greater depth than has ever before been reached on the vein in either the Ophir or Mexican.

From the Trespass of Feb. 11th: Work on the new shaft of the Imperial Company was stopped on Saturday for repairs. The shaft has reached a depth of about 800 feet. The rock does not require blasting, and there is very little water to contend with.

Yellow Jacket Company is sinking for a new level in their south mine, and have already attained the depth of thirty feet.

The Petaluma mill, recently improved, has been leased by Messrs. Walker, of the Bullion, and Tritle of the Belcher, and is now at work upon the reduction of ore from the Kentucky mine.

Same of 15th: In the Plato mine, Gold Hill, a drift is being run from the bottom of the new incline, which is 150 feet in depth, to cut the ledge. The engine, formerly the property of the Miantonomah Company, has been set up, and is doing excellent work.

On Cedar Hill, so crowded with mines in 1861, the Sierra Nevada alone is being worked to-day.

From the Gold Hill News of Feb. 11th: The Savage mining works, which have been shut down for a few days, started up again on Saturday evening. We do not know how the lawsuit has been disposed of, but it is the desire of every one interested in the welfare of the country that the matter will be settled so that the mine may continue work.

In the Bullion mine, a drift for air is being run. The work of prospecting the new discovery will be resumed as soon as the drift is completed.

Same of 13th: All the mills in Gold and Six-Mile Cañons, on the Carson river, and in Washoe, have started up again.

ECONOMICAL PUMPING.—It is estimated, says the Nevada Transcript, that about three-fourths of the water to be pumped from the Cunningham mine comes from the surface and finds its way to the bottom. The superintendent, John Pattison, runs two pumps. An 8-inch Cornish pump is placed one hundred feet below the surface, and kept running on a half stroke. A 5-inch pump of the same kind is kept at the bottom of the mine. The well at the upper pump catches all the surface water, which has only to be raised one hundred feet, whereas if only one pump were used it would have to be lifted double the distance. The Cunningham has now as much water as it ever will have, but the pumps are only worked to about one-fifth their capacity.

From 1856 to 1865, ten years, two thousand and nineteen deaths occurred from explosions of fire damp.

## Canvassing Agents.

Mr. Thomas Starr is Agent for the Mining and Scientific Press in Nevada, and will canvass the principal cities, towns and districts of that State. August 25, 1886.  
Mr. L. W. Felton, is an authorized agent for this paper at Portland Oregon. Dec. 1, 1886.  
Mr. S. D. Whitaker, is our authorized Traveling Agent and Solicitor from this date. Jan. 1, 1887.

## San Francisco:

Saturday Morning, Feb. 23, 1867.

## Notices to Correspondents.

DEMYUS.—The rationale of the production of Tremolite, which was adverted to in our notices of "Contributions to our Cabinet," in last week's publication, can be explained in detail as follows: Actinolite, which is a variety of hornblende, has a composition, on the average, as follows:

Lime.....	14.60 per cent.
Magnesia.....	21.00 per cent.
Iron.....	5.00 per cent.
Silica (and quartz).....	65.00 per cent.
	100.00

## Tremolite consists of—

Lime.....	14.00 per cent.
Magnesia.....	23.00 per cent.
Silica.....	61.00 per cent.
	100.00

The small quantity of fluorine, said to be always present, is dismissed from the calculation. There are aluminous tremolites, which have probably been formed from common aluminous hornblende, as may be observed by the following account of the analysis of each:

## Analysis of Common Hornblende:

	I.	II.
Lime.....	14.00	10.00
Magnesia.....	19.00	13.00
Oxide of iron.....	8.00	20.00
Silica.....	46.00	50.00
Alumina.....	13.00	7.00
	100.00	100.00

## Analysis of Aluminous Tremolite:

Lime.....	13.00
Magnesia.....	22.00
Silica.....	48.00
Alumina.....	14.00
Oxide of iron.....	3.00
	100.00

Moreover, the specific gravity of Tremolite is only 2.93, whilst that of Actinolite is 3.03; the lower specific gravity of the former may not unfairly be assigned to the non-presence of the iron, which forms one of the component parts of the latter; an absence which we think may be fairly attributed to the cause which we have alluded to in our former notice. In the first quoted analysis of Tremolite, probably metamorphosed from Actinolite, it would appear that a portion of magnesia was dissolved and carried away in company with the oxide of iron, by acidulated water. In the second series of analysis, viz: those minerals associated with alumina, it would appear that it was the oxide of iron that was dissolved out. Carbonated acidulous waters, such as Seltzer, are well known, whilst sulphuric acid is found, in some cases, in large quantity, the most notable instances being those of the Rio Tinto, in Europe, and the very extraordinary one of the Rio Vinaigre (so called from its sour taste), in South America.

J. S.—The value of a cement of whatever kind resides in its power of adhesion. It sometimes happens that this force surpasses the cohesion of the bodies cemented. It is from this cause that trial pieces of wood, such as a ship's mast, cemented with what is termed marine glue, when torn asunder, is usually found rent not at the planes of cementation, but along a ragged outline in the solid wood. It is in this way that the curious feat of splitting a bank-note into two laminae is accomplished—that is, by firmly cementing the note between two flat surfaces, and subsequently gradually withdrawing the pieces cemented. The cohesion of the paper being feebler than the adhesion to the cement, the paper becomes split through its center. This method of splitting paper has been long known to hull cutters and inlayers.

W. Y.—Capillary attraction is owing to the balance of the forces of adhesion and cohesion between solids and liquids under the simultaneous influence of gravity. Adhesion is the power exerted which holds together particles of matter dissimilar in character; cohesion is the power which holds together particles of matter possessing a similar composition.

## Argentiferous Lead Smelting in Humboldt County, Nevada.

## NUMBER ONE.

Numerous efforts have been made, at different times and places, to put in operation, on this coast, smelting works for the reduction of argentiferous lead ores, and silver ores proper, which cannot be successfully treated in the wet way; but we believe that in every case hitherto reported, either partial success only, or utter failure has been the result. Works for treating the simpler ores of copper (carbonates) have, however, met with better success, and considerable amount of that metal, so obtained, has found its way to this city. Extensive works for treating the poorer sulphuret copper ores, were put up, some two years ago, at Cop-peropolis, which were also a success, so far as securing the metal was concerned; but which failed in a pecuniary point of view, in consequence of the great cost of labor and fuel.

A large amount of money, however, has been sunk in unsuccessful enterprises of this kind, which owe their want of success either to inexperience, or to attempts to improve, by new "processes," on those which have been gradually built up on the results of many years of experience and study on the part of the ablest metallurgists of Europe. The folly of such a course ought to have been apparent to any person of ordinary business capacity. It is to be hoped that the experience of the past will teach Californians to let well enough alone, and lead them hereafter to put their confidence in experienced persons only, avoiding all "new process" men, as mere ignorant pretenders. Not that improvements are entirely out of the question; but that they should be introduced only under the direction of capable, cautious and practical men; such as have first made themselves well acquainted with all the old processes.

But with all this unpleasant and costly experience, it gives us pleasure to refer to at least one company which, believing that what has been so successfully carried on in the Old World, for centuries, could be made a like success here, has tried the experiment with the most satisfactory results; and furnished the most indubitable evidence that a large remunerative profit can be derived from the reduction of our rich lead and silver ores by smelting at the mine, even in the distant Humboldt River Valley. We allude to the

## TRINITY AND SACRAMENTO SILVER MINING COMPANY,

Of the city of New York, operating under the management of Mr. A. W. Nason, as Superintendent. During the past year, this company has become the owner of the well known Montezuma mine, near the town of Oreana, on the Humboldt river, State of Nevada, at a cost of \$100,000. They have erected smelting works of a capacity for reducing from fifteen to twenty tons of ore per day, which have been in constant operation for nearly four months. The smelting, we are assured, has been a perfect success from the start; although the refining was attended with some considerable trouble at first, by reason of the presence of a large quantity of antimony and iron in the crude metal obtained from the ore, and the difficulty of obtaining suitable refractory material for the construction of their furnaces. Experience and patience, however, with the avoidance of untried experiments, soon overcame the obstacles, and the company is now making regular shipments of silver bullion of the highest grade, and at a fine profit. A shipment of some fifty tons of lead, will also soon be made to parties in this city, with whom lead is a leading consideration. In view of this successful result, there is good reason to expect that the mines of the Pacific Coast will soon be able to supply, not only the home demand for this useful metal, but also form a material item in our metallic exports.

## THE WORKS OF THE COMPANY

Consist of a mill department, for the reduction of such ores as will yield readily to the mill process—a considerable quantity of which is found; a smelting department for the more refractory ores; a calcining department, for removing the antimony and iron, or other base metals, from the crude products of the smelting furnace, and a refining department, in which the lead is separated from the silver, which latter product is shipped to this city as bullion. At present but a small portion, only, of the lead, will be shipped from the mine; the balance being kept in store as litharge or in hars, for shipment when the cost of transportation shall be reduced by the nearer approach to that region of the Central Pacific Railroad, the surveyed line of which passes within less than two miles of the company's works. When the works are fully completed, which will be in a few weeks, they will have cost the company fully sixty thousand dollars, and will be able to turn out from \$1,500 to \$2,000 per day in silver alone. It is confidently expected that the railroad will reach the locality of this mine before the close of next year. It will be completed to Crystal Peak, at the eastern part of the Sierra Nevada, 125 miles from the company's mine, during the present year. The company is now hauling the rails over the Summit on runners, so that the same may be laid from the eastern end of the Summit tunnel to Crystal Peak by the time the tunnel itself is completed, and the track laid up to its western terminus.

## THE MONTEZUMA MINE,

From which the company obtain their ore, is a lode consisting of an earthy carbonate of lead, intermixed but sparsely with acicular crystals, yielding, in metals, about as follows:

Antimony.....	30 per cent.
Iron.....	4 "
Lead and silver.....	65 "
	100

The yield of silver per ton of ore, varies from \$80 to \$200. There is very little gangue, and no perceptible amount of silica is present. No sulphurets in quantity have yet been found. The lode varies from ten to fifteen feet in thickness, and is very uniform from wall to wall. The deepest shaft is but sixty feet. The most of the ore hitherto raised, has been taken out within five feet of the surface. The character of the lode will undoubtedly change to a sulphide as soon as the company shall have penetrated to a short distance below the present water level. Four or five men, for the present, are able to take out mineral enough to keep the works in constant operation.

A want of skilled labor was felt for a time, and still continues to some extent. Experienced hands, in this branch of mining and metallurgy, will do well to put themselves in communication with this company, as employment there, when obtained, will in all probability be steady, and the company are paying liberal prices.

As already intimated, three processes are employed in the furnace operations of the company, before the lead and silver are finally obtained as separate products. As much interest is now being felt in the working of lead ores, which are found in large quantities at various points on this coast, we have thought it would be a matter of especial interest to our readers to see a full description of the appliances and processes employed by this company in working their ores. We will endeavor to describe these as fully as we can without the help of illustrations. Any person who has either Muspratt's Chemistry, Ure's Dictionary of Arts and Sciences, or Lamborn's Treatise on Silver and Lead, will find illustrated in those works very nearly the same furnaces which we propose to describe. Some slight modifications have been introduced by Mr. Nason, but not sufficient to show any essential difference of construction. The ore, as it comes from the mine, is first subjected to an ordinary smelting operation, which, together with the subsequent processes employed at their works in obtaining the silver, lead, and antimony, as separate metals, will be fully described next week.

[To be Continued.]

## Auriferous Sulphurets not Always Found in Connection with Quartz.

The fact is now pretty well established that auriferous sulphurets are not always associated with quartz, or in fact with any vein matter whatever. We have several times alluded to the fact that gold has been found in sulphurets taken from the country rock, especially slate, at long distances from any indication of a vein or lode of any kind whatever. The writer in Dicker's *Mining Record*, of October 2d, 1866, elsewhere quoted, speaking of his examinations in Australia, says:

I have for many years inclined to the belief that the mundic [auriferous sulphurets] was the original matrix of the gold; for while I have found quartz in plenty without gold, I have never found mundic, whether in the lode or in the country [the enclosing rock], which has not held more or less gold. \* \* \* In a mine I had charge of, I took mundic from a vein of pure mundic, about half an inch thick, running through the country, at least 100 feet from any quartz lode, from which I obtained nearly one ounce of gold from the hundred weight of sulphurets [by roasting and smelting].

Mr. Thompson, of the Port Philip Mining Company, at Clunes, Australia, has had the same experience in experimenting with the mundic in the vicinity of that mine.

Dr. R. P. Stevens read a very interesting paper before the New York Lyceum of Natural History, on the 18th of December last, in which he alludes to the occurrence of gold in the sulphurets found associated with the slates of North Carolina, for many miles in extent. The gold is there found not only in the sulphurets, but also, in small quantities, disseminated throughout the mass of the talcose slates. Such is also the evidence of Professor Tuomey and Professor E. Emmons, recently deceased. Prof. E. saw strata of slates, many hundred feet in width, from the decomposed surfaces of which gold could be obtained by panning. Careful examinations of the rock itself proved conclusively that this gold was derived from the decomposed rock, and not from auriferous gravel deposited upon them by the action of water.

A similar mass of talcose slate is now being worked for gold in the lower portion of this State—in Amador county, if we are not mistaken. The rock is taken out as from a quarry, without any indication whatever of a vein or lode of any kind. Possibly there may be other similar localities in the State.

These facts, as well as others elsewhere given in the present issue, in relation to the treatment of sulphurets, serve to show that we have much yet to learn with regard to the occurrence of gold and the manner of treating its ores. There is a large and inviting field open in this direction, both for the scientific and practical miner. Both are needed for its development, and they should work together for the general advancement of the great and important interest of gold mining.

GOLDEN CITY CHEMICAL WORKS.—This is the name of a new corporation, dating from February 19th. The object is for "the manufacturing of acids and chemicals of every description." The amount of capital stock is \$500,000, divided into 5,000 shares of \$100 each. The incorporators are H. P. Wakelee, Thos. H. Selby, Alpheus Bull, John Parrott, Nicholas Lunig, Wm. E. Barron, Thos. Bell, A. Hayward, Chas. E. McLane, and P. L. Weaver.

PERSONAL.—Mr. Wm. R. Bradshaw, formerly attached to this office, but recently a teacher in the Oakland public school department, has been elected to an honorable position in the Monmouth College, Oregon. He leaves to-day on the steamer Oriflamme, for Portland. As a young man of sterling qualities, we wish him success.

TABLE ROCK.—The remaining portion of this noted natural curiosity, so well known to all visitors at Niagara, fell on the 14th.

### Interesting Experiments with Auriferous Sulphurets.

We subjoin the following interesting detail of a series of experiments made with auriferous sulphurets, in Australia, by a gentleman who communicates the facts to Dicker's *Mining Record*, of October 23d, 1866, over the signature of "Mining Engineer." We give the detail substantially in the words of the correspondent of the *Record*. The 10 cwt. of "Mundic," (auriferous sulphurets), which was made the subject of these experiments, was concentrated from about 40 tons of quartz.

He took the 10 cwt. of mundic, and first amalgamated it in a Freiberg barrel, to get out as much as possible of the fine gold which had escaped from the battery; he got out about 5 dwts. He then divided the mass into four charges, and roasted each charge 24 hours in a reverberatory furnace, the sole of which was about 12 feet by 6 in superficial dimension. The roasting was kept up at a dull heat, the sulphurets being constantly stirred. He then ground the roasted mass in a Chile mill, until the 10 cwt. was reduced to 2½ cwt. This 2½ cwt. was then put in the barrel, with 170 pounds of quicksilver, half a pint of muriatic acid, 15 pounds of salt, 75 pounds of scrap iron and 14 buckets of boiling water; the barrel was allowed to rotate for 24 hours. He then carefully collected the quicksilver—losing 1 pound out of the 170 placed in the barrel. The entire mass of quicksilver was carefully retorted, and only nine pennyweights of gold obtained.

He next took the 2½ cwt. of roasted ore which had been worked in the barrel, and re-roasted it 24 hours; re-ground as before, and concentrated the mass to about four tin dishes; this he panned down to 27 ounces, dry. He put the 27 ounces into a bucket with 84 pounds of quicksilver, and kept a boy stirring it with hot water and salt for five hours, when he drew off and retorted all the quicksilver, obtaining only a trace of gold. The 27 ounces of residuum was then dried and smelted. Nine ounces and twelve dwts. of gold was obtained from this process! Two other lots of sulphurets, of five and three hundred weight each, were submitted to the same treatment, with similar results in both cases.

The inference very naturally drawn from the above experiments, is that the gold in sulphurets cannot be obtained by amalgamation, or only partially so. It will be interesting, in this connection, to refer to the experiments which we published in our issue of January 5th, where amalgamation in pans was tried against the chlorine process. In that case, several lots of sulphurets were worked from the same heap, of uniform richness, which assayed \$460 to the ton. The first lot was worked raw, by pan process; the second lot was treated in the same pan, after roasting, and the third lot was first roasted and then subjected to the chlorination process. The following are the results: worked by pan process raw, \$336; by pan process after roasting, \$240; by chlorination process, \$414.

The difference in the yield between the amalgamating process and that of smelting, in the Australian experiments, is out of all proportion, as compared with the difference between amalgamation and chlorination at Grass Valley. Allowing the experiments in Australia to have been correctly reported, of which there can be little doubt, we must suppose that the gold in the Australian sulphurets was differently conditioned from that usually found in sulphurets in this country.

It should be noted, however, that the sulphurets appear to have been roasted, in the Australian experiments, at "a dull red heat" only; while to arrive at a proper desulphurization the final roasting should have been kept for some time at a bright red heat. Had they been subjected to such a heat, there is no doubt but that a large proportion of the nine ounces obtained by smelting, would have been recovered in the previous barrel operation.

Still, that differences do exist there can be no doubt. Gold in sulphurets is sometimes visible to the naked eye, in others invisible to the most careful microscopic examination; although the crucible, in the latter case,

shows that it is present. Hence it is but fair to conclude that different degrees of success may attend amalgamation when applied to sulphurets from different localities.

The above facts and suggestions commend themselves to the serious consideration of all persons interested in mining for gold.

### Contributed for Our Cabinet.

Under this heading we shall continue to mention and describe, according to merit, such specimens of ores, minerals, fossils, curiosities, etc., as may be presented, or forwarded to us by mail or express, prepaid. Each article will be numbered and placed in our cabinet, and recorded with the name of the donor, and the claim or location from whence it came.

137.—MR. T. STAR sends us a specimen from the U. S. Grant mine of Meadow Lake. The lode at this mine averages about four feet in thickness. Near the center is a streak of decomposed sulphurets, about four inches in thickness, very rich in gold, which is seen all through the same, without the aid of a glass. The quartz which accompanies the sulphurets is highly vitreous in character, presenting the appearance of having been subjected to great and long continued heat.

138.—CAPT. WILLIAMS, Superintendent, has contributed to our cabinet a specimen of ore from the Sance mine, Lower California, together with a sample of the native metal (copper), as taken from the battery of the stamp mill, also the sulphurets (vitreous) as collected by concentration. An extended notice of this mine will be found in another column of our present issue.

139.—CAPT. WILLIAMS also presents us a specimen from the Giantess mine, located near by the Sance, and belonging to the same company. The Giantess lode carries a notable quantity of silver as well as copper.

NEVADA LEGISLATURE AND THE SUTRO TUNNEL.—We have received a copy of a neat quarto pamphlet, containing the "Joint Memorial and Resolutions of the Nevada Legislature, asking Government aid in the construction of the Sutro Tunnel, together with the Report of the Senate Committee on Federal Relations," showing the importance of the work. Also proceedings of the Nevada Legislature in regard to the matter. We quote the concurrent resolutions complimentary to Mr. Sutro, which were passed by that body:

*Resolved*, by the Senate, the Assembly concurring, That the Legislature of Nevada recognize, as already due, and cordially extend the thanks of the people of this State to Adolph Sutro, for his great service in originating the Sutro Tunnel, and urging aid and organization for undertaking work upon the same; and be it further concurrently *Resolved*, That we have entire confidence in the ability of Mr. Sutro to present to Congressmen and capitalists the claims of the enterprise referred to, knowing that he will prepare with skill, and clearly exhibit the whole statistical and political economical argument bearing in its favor, without overlooking or exaggerating any of its merits.

A handsomely engrossed copy of these resolutions was prepared by the Secretary, per order of the Senate, and forwarded to Mr. Sutro.

REPEAL OF A NEVADA MINING STATUTE. The bill before the Nevada Legislature, repealing the Act known as the "Banks' Location and Possession of Mines Bill," has been approved by the Governor. This law was, in many respects, objectionable, and its repeal will be satisfactory to most of the Nevada miners. It was partial in its operation, applying as it did to the whole State, except Storey county, wherein were, at the time of the passage of the law, most of the richest mines in the State. The provision for the payment of "assessment dues" of two cents per foot per annum, as sufficient to hold a claim, was an abuse unheard of elsewhere. J. Ross Browne, in his recent report on the mines, alludes to this law as in itself showing the need of Congressional interference between the laborer and the monopolist. Hereafter titles will depend upon the local regulations.

The quality of wool is determined by the number of spirals. The best has about thirty "crinkles" in an inch.

PROF. LAYRES' lectures on oratory, to which we alluded in our last, will be given hereafter at the rooms of the Young Men's Christian Association, No. 526 California street, above Montgomery. On account of yesterday being kept as a holiday, the lecture announced for last evening, has been postponed to this evening. These lectures are well worth attending by all who take an interest in such matters. Mr. Layres possesses the happy faculty of making interesting, a subject, which, in most hands, is especially dry and devoid of interest.

DEATH OF A SCIENTIFIC MAN.—Professor Alexander D. Bache, President of the United States Coast Survey, died at Newport, Rhode Island, on the 19th instant, aged sixty years. He was a great-grandson of Benj. Franklin. He was educated at West Point, and held at one time a Professorship in the University of Pennsylvania, and afterwards the Presidency of Girard College. In 1843, he took, at the request of the Government, the position which he occupied at the time of his death. He was a member of several scientific societies, both in this country and in Europe.

ARSENIO IN INK.—It is said that the well known popular French copying ink contains more or less arsenic. Perhaps other inks may also contain that poison. If so, may not the disease which has quite recently made its appearance among clerks and others, who spend the most of their time in writing, and which is known as "pen palsy," owes its origin to the poisonous qualities of the arsenic contained in the ink? The idea that this is the fact has been suggested.

MONO SILVER.—The item in the Sacramento *Union*, copied into our issue of Jan. 12th, credited 3,000 pounds of silver bullion to the "Chrysopolis" mine, in Blind Spring district, Mono county. This should have been the "Cornucopia" mine. Another shipment from this same mine is chronicled in our last week's issue. We are informed that this mine is the property of a Philadelphia company, and that the bullion referred to was smelted at Partzwick.

DIFFERENCE IN WEIGHT.—A cubic mile of water, at a temperature of 40°, is 900,000 tons heavier than at 50°, and 3,000,000 tons heavier than at 60°. The difference would be caused by the overflow and waste from expansion when raised to the higher temperatures.

ICE BOATING, which has recently become quite a matter of amusement on the Hudson and some other of the northern rivers, will, it is thought, soon be practically applied to business purposes, for conveying freight and passengers. There appears to be money in it.

For California hand-books on California industrial enterprises, such as Prevost's "Silk Growers' Manual," and Hyatt's "Hand-Book of Grape Culture," go to H. H. Bancroft & Co's.

### City Amusements.

METROPOLITAN.—At this theater "Raoul; or the Magic Star," was produced on Monday night, with A. Lehman as "Baron Zambrath," Julien Martinetti as "Courcel," his servant, M. Schmidt as "Raoul," Paul Martinetti as "Artos," and Madame Marzetti as "Ceclia." This is one of the best pantomimes yet produced, and is full of mysterious tricks. Julien Martinetti as "Courcel" meets with numerous disasters, but neither he nor his master seem to be disheartened by their mishaps, or to relinquish their pursuit of the lovers. Paul as "Artos" is also very good. Wednesday night the pantomime was preceded by the comic ballet of the "Milliners," and the "Boquet," the entertainment commencing with "How to settle accounts with your Landlady," by the Howsons.

OPERA HOUSE.—Tuesday night, "The Orange Girl; or the Sacred Trust," was produced for the first time, Mrs. Edwin taking the part of "Jane" the orange girl, and Miss Kingsbury that of "Jennie," the orphan, who is protected by Jane. Friday night, "Fanchon."

ACADEMY OF MUSIC.—Martin, the great professor of magic and ventriloquism, was announced to appear here on Thursday evening, but postponed his entertainment on account of the weather, which has considerably effected the business of all the theaters during this week.

PLATT'S HALL.—Mrs. Lizzie Parker Northrup's concert, also postponed from Thursday night, will take place on Monday evening, Feb. 25th.

Our Free List in San Francisco, will hereafter receive the Press through the post office, postage free.

MINERS' UNION.—The miners in Gold Hill district have formed themselves into a "Union" for mutual aid and protection. A fund will be created for the relief of sick or disabled members, or their families. Four dollars per day is established as the rate of wages.

### National Mineral Land Law, Instructions. Blanks, Etc.

Copies of the Act of Congress, approved July 26th, 1866, relating to the Location of Mineral Lands, together with the instructions to the "United States Registers and Receivers and Surveyors General," from the Commissioner of the General Land Office Department of the Interior, dated at Washington, Jan. 14th, 1867, can be had at this office. Also a full set of blanks for making applications, advertising, etc. Address DEWEY & Co., office Mining and Scientific Press, San Francisco.

### A Paying Newspaper for Sale.

A one-half interest in one of the best County Papers in the State, is offered for sale on desirable terms. The journal is the oldest in the county, is situated at the County Seat, and surrounded by one of the most prosperous and promising Quartz and Gravel Mining Districts in the State. Inquire at the office of the *Mining and Scientific Press*, or address DEWEY & VAUGHN, Mountain Messenger office, Downsville, Sierra County, Cal. 7v14t

### Wanted!

\$10,000 FOR ONE YEAR, ON A VALUABLE Ranch. Title perfect. A liberal per centage given. Apply at No. 410 Kearny Street, Room No. 2, any day, at 5 o'clock P. M. 8v14t

### V. CUSHING, Agent

For the Purchase and Shipping of Machinery OF ALL KINDS.

SPECIAL ATTENTION GIVEN TO QUARTZ MILL Machinery and Findings, and Mineral Material of every description. Being a PRATYCAL MACHINIST, and giving my personal attention to the execution of orders, I can guarantee the BEST class of work at the LOWEST PRICE in the city. Office, No. 120 Front street, San Francisco. 8v14t

### MEUSSDORFFER,

Nos. 635 and 637 Commercial Street, WILL INTRODUCE

On Saturday, February 9, 1867.

### An Entirely New Style of

Cloth Cashmere Hat

### "YACHT HENRIETTA,"

Which are the most dressy Hat ever introduced on the Pacific Coast.

Call and see them. 8v14

### A. S. Hallidie & Co.,

MANUFACTURERS OF FLAT & ROUND WIRE ROPE, For Mining, Shipping, Ferry, AND GENERAL PURPOSES.

Office—412 Clay street. Works—North Beach.

NOTICE.—THE FIRST COST OF WIRE ROPE IS MUCH less than that of any other kind of Rope of equal strength, and it is four times as durable. Wire Rope does not stretch or shrink by atmospheric changes; it has but one-fifth the bulk of Hempen Rope; is spliced and repaired in the same manner.

The attention of Mining Companies is particularly called to our Flat and Round Hoisting Ropes, which have been in use for a number of years by the leading mines on this Coast, and to many of whom we refer those interested as to the great advantages over any other kind of rope; effecting an immense saving in expenditure for ropes, fuel, wear and tear of machinery, stoppage of works, etc., besides increasing safety of life.

Mining Companies, in erecting Hoisting Works, should be sure and have their drums and pulleys of sufficient size, whether for wire or hemp rope.

We manufacture of all sizes, and in any length—

Round Wire Rope—Iron or Steel, for Hoisting.

Flat Wire Rope—

Soft Steel Wire Rope—For Derrick Fall Ropes—

very strong and durable—one third the weight of hemp of equal strength, (saving in freight for remote localities). Suitable sheaves and blocks furnished when required.

Galvanized or Ungalvanized Round Wire Rope—For Ships' Rigging, Derrick guys, Ferry Ropes, and all standing purposes.

Steel Ferry Ropes—For wide streams. Ferry Blocks supplied.

Iron and Copper Wire Cord—½ to ½-inch diameter, for hanging window shades; Signal Cord; Sash Pulleys on hand.

Comparative Weight, Size and Strength of Iron Wire Rope, Steel Wire Rope, Hemp Rope, and Chain.

Iron Wire Rope.	Steel Wire Rope.	Hemp Rope.	Chain.	Equivalent Strength.

### J. S. PHILLIPS, O. E. M.,

Mining Engineer of Cornwall,

WHO CAME TO WORK LEDGES FOR A NEW YORK company, at Humboldt, Nevada, is free for examination or Superintendence of Mineral Properties, in consequence of his condemnation and immediate abandonment of those operations. References—B. W. Mendenhall, 623 Clay street, San Francisco, Humboldt City, Nevada. 6v14t

Established in 1849--Corner First and Mission streets, San Francisco.

HAVING INCREASED OUR FACILITIES IN EVERY DEPARTMENT, WE ARE NOW prepared at the shortest notice and at the most reasonable rates, to furnish all kinds and description of Machinery, including Steam Engines, Quartz Mills, Mining Pumps of all kinds, Hoisting Gear, Gas Work, Laundry Machinery, Architectural and Ornamental Castings, Sugar Mills, Saw and Flour Mills, Water Wheels of all kinds, Hydraulic, Hay, Rag, screw and Drop Presses, Coining Machinery, Pile Drivers, Bark and Malt Mills, and all kinds of Castings.

**ENGINES.**—Marine Engines, Oscillating and Beam; Stern and Side Wheel Boats, Locomotives, Stationary Engines, Horizontal, Upright, Oscillating and Beam, from six to fifty inches diameter. Also, Scott & Eckart's Adjustable Cut-off Regulator—best in use; W. R. Eckart's Balance Valve for Stationary Engines; Woodward's Patent Steam Pump and Fire Engine.

**BOILERS.** Locomotive, Flue, Tubular, Upright, Cylinder and Cornish, and every variety of Boiler Work. All sizes of tubes and pipes for pumps.

**PUMPS.**—The Excelsior double-acting Force Pumps are manufactured by us. These very superior Pumps are warranted the best, and are fast replacing all other Force Pumps.

**AMALGAMATING MACHINERY.**—Wheeler & Randall's Improved Tractory Curve Pan, Zenas Wheeler's improved flat bottom pan, Beldin's pan, Veatch's tubs, Frater's concentrators, Wakle's pans, Beers' pan, German Barrels, Arastra Gearing, Chile Mills, Settlers of all descriptions, Retorts of all sizes and shapes, for Silver and Gold, Portable Stamp Mills, Straight Batteries, for wood or iron frames, Dry Crushing Batteries, or machines with the latest improvements, every variety of Stamps, Mortars, Cams, Pans and Tubs. **BLAKE'S PATENT QUARTZ CRUSHERS**, of all sizes.

**OIL BORING TOOLS AND MACHINERY.**—Of the latest and most approved construction, made from drawings lately made by Prof. Blake at the oil wells in Pennsylvania. We have the facilities for working gold and silver quartz and other ores, to test their value, by the hundred weight or ton.

Russia Iron Screens, of all degrees of fineness and of all qualities of iron. All work done in the best manner at the lowest cash prices.

H. J. BOOTH. GEO. W. PRESCOTT. IRVING M. SCOTT.

MADE.

All Boilers guaranteed and tested by U. S. Boiler Inspector before sent out of the Shop, at Shop expense.

All kinds of Sheet Iron and Water Pipe, Coal Oil Stills, Wrought Iron Worms, etc., etc. Manufactured to Order.

**Old Boilers Repaired**  
**D. CAMERON.**

6v12-ly

**CAPITAL WANTED, NOT LABOR.**—The Nevada Gazette of February 18th, in an article entitled "Immigrant Aid Societies," says:

It is a little remarkable that in the place where the fever for an immigrant aid society prevails, a most brutal mob has just wreaked its vengeance on Chinamen who come in competition with white labor in the market. \* \* \* The truth is, there is more labor in the country to-day than capital willing to employ it, and it is the height of foolishness to import more unless capital comes with it. Give us that, and labor will come without the aid of societies.

THE Nevada Gazette says, the patent for Bradford's "Ore Separator," will expire in the spring. Heretofore, their price has been from \$300 to \$600 each, although they can be made for \$100 to \$150.

**COAL IN SHASTA.**—Shasta county has a coal mine, all ready to assist in working the silver mines of South Fork District, in case they should prove to be what is expected of them.

**LOCUST TREES**, to the amount of a hundred acres, will be planted this year by Josiah Sturgis of Martinez.

Orders from the Interior faithfully attended to.

Such a Journal has been needed on the Pacific Coast. The Press fills the bill.—*Revere River Teller.*

**TO LIGHT A DARK ROOM.**—A room which is so situated, in a narrow street, that it would be nearly dark if furnished with windows of the ordinary style, the glass of which is several inches within the outer face of the wall, can be effectually lighted in the following manner: If, says the *London Builder*, for the window be substituted another in which all the panes of glass are roughly ground on the outside, and flush with the outer wall, the light from the whole of the visible sky and from the remotest parts of the opposite wall will be introduced into the apartment, reflected from the innumerable faces or facets which the rough grinding of the glass has produced. The whole window will appear as if the sky were beyond it, and from every point of this luminous surface light will radiate into all parts of the room.

A gun often becomes foul from use, so that the cap explodes without igniting the powder. Instead of pricking powder into the tube, it is said that the best way is to drive a pine plug into it, and cut it off even with the top. The cap is then put on, and the gun is sure to go.

The priceless paintings in the Louvre have been photographed. Copies are in New York. The works of Raphael and Michael Angelo can be seen in all their perfection, as well as imperfection. Every wrinkle and every crack in the canvas is faithfully reproduced.

The new woolen mill is to be lighted by gas made on the premises, from pine wood and animal refuse, by Ensley's process, which we described in our issue of January 12th.

The GREAT EASTERN, which is only used on great occasions, will convey passengers to the Paris Exposition. She will run regularly between Brest and New York. Wells, Fargo & Co., will be the ticket agents in San Francisco.

MOUNT DIABLO COAL, says the *Stockton Independent*, is increasing in favor for steam engines and for household use.

**Remarkable Cure of J. Calwell.**  
Who had all the symptoms of being in the last stage of consumption, by the use of ALLEN'S LUNG BALM.  
DEAR, Hamilton County, Ohio, April 6, 1885.—Messrs. HARRIS & CO.: Gentlemen—As I have reason to believe that Allen's Lung Balm has been the means of restoring my health, I feel that the afflicted ought to know what it is doing. I was first attacked with a violent cough, attended with cold night sweats. My feet and limbs were chilled. The above symptoms continued for months, until I became confined to my bed, and reduced almost to a skeleton. My physicians and friends considered my case as entirely hopeless; that I could not live. At this crisis I commenced to use Allen's Lung Balm, which was strongly recommended to me for the cure of consumption. To the astonishment of all, I began to recover almost immediately, and in less than three months' time I gained sixty pounds. I owe all to the use of Allen's Lung Balm. I now enjoy good health. Respectfully yours, JAMES CALWELL.  
Sold by all Medicine dealers every where. 4v14-1in

**To Owners of Copper Mines and Smelting Works.**

A PERSON OF LARGE EXPERIENCE IN COPPER Smelting, both in the Atlantic States and California, wishes a situation as Superintendent of an establishment for Smelting Copper. Address "W," care of Mining and Scientific Press. 6v14-1in

The Largest Business,  
The Largest Income,

And as it obtains the LARGEST average rate of interest on its investments, and has had, through its whole history, the SMALLEST average expenses, it therefore affords insurance at LESS COST than any other Company.

The surplus premium (dividend) returned to Policy Holders during the current year is SIXTY PER CENT of the premium paid during the year ending 31st of January, 1886.

Insurance can be effected in this Company in all the forms desired, and to meet all the contingencies in which Life Insurance is applicable, among which terms are—

Whole Life Policies, by a continued annual life premium.

Whole Life Policies, by TEN annual premiums.

Endowment Policies, by a continued annual premium.

Endowment Policies, by a limited annual premium, for FIVE, TEN, FIFTEEN or TWENTY years.

Endowment Policies, made payable at any age stipulated.

ALL POLICIES issued by this Company are either non-forfeitable by their terms, or may be converted into those which are so, at the option of the insured.

This Company offers all the advantages of a CASH or NOTE Company. The assured are not required to give a note in part payment of the premium, but may, if preferred, pay the first four premiums in cash after which their dividends are Annual Premium Life, and Continued Premium Endowment Policies, will, in the past success of the Company is continued, reduce their premiums one-half. When notes are given for Annual Life and Continued Endowment Premiums, no notes will be required after the fourth payment, and the returned surplus—dividends—will be supplied as cash to the reduction of the annual premium.

None but Unexceptional Risks Accepted; and only upon ages between Fourteen and Sixty.

## Accidental Insurance!

The Accidental Insurance Company OF NEW YORK.

ISSUES POLICIES INSURING AGAINST INJURIES OF all kinds, and death resulting from accident. In case death does not result from the injury, he insured receives a weekly compensation as long as he is disabled (not to exceed twenty six weeks).

## ONE YEAR POLICIES.

\$5 will buy Policy for \$1,000, with weekly compensation of \$5.  
\$10 will buy Policy for \$2,000, with weekly compensation of \$10.  
\$50 will buy Policy for \$10,000, with weekly compensation of \$50.

## SHORT TERM POLICIES.

Policies will also be issued for any other amounts within the limits before stated, for periods of one to six months, at rates in tenths of the Annual rate, as follows:

1 month, 2-10. 4 months, 5-10.  
2 " 3-10. 5 " 6-10.  
3 " 4-10. 6 " 7-10.

## GENERAL ACCIDENT TICKETS.

This Company also issues Tickets which are sold by many of its Agents at Hotels and Ticket Offices through the country.

They make Insurance for \$5,000, and \$25 per week compensation, against Accident, of every description, Travelling or otherwise; good for one to six days, as required, at TWENTY-FIVE CENTS PER DAY.

They are not simply Travelers' Insurance Tickets which cover only injury or death, the result of an "Accident to the Public conveyance in which the insured may at the time be travelling," but they are GENERAL ACCIDENT TICKETS.

## SEA VOYAGE POLICIES

Are issued, covering the risks of travel to European and other Ports. Rates varying with the season, and the voyage to be taken. Information can be had of the Company or its Agents.

The Company has a PAID UP CASH CAPITAL OF \$250,000. One hundred thousand dollars deposited with Wm. Barnes, Esq., Superintendent of the Insurance Department of the State of New York, and the remainder securely invested in Stocks in the hands of the Company.

## INDUCEMENTS.

The rates of Premium are very low. The Plan is so simple that any one can comprehend it in its workings.

No Medical EXAMINATION is required, and those who have been rejected by Life Companies, in consequence of hereditary or other diseases, can effect Insurance in this Company at a very small cost.

No better or more satisfactory use can be made of so small a sum.

Our Circulation.—THE MINING AND SCIENTIFIC PRESS  
has a large and permanent subscription list, and enjoys a  
more universal circulation among stockholders and per-  
sons directly interested in mining than any other paper on  
this coast.

## Important to Secretaries.

Secretaries will please write proper names and figures  
distinctly, and hand in their advertisements as early in the  
week as practicable. Our latest forms go to press Friday  
evening. Any information concerning the requirements of  
the laws regarding advertisements will be cheerfully given  
when solicited. Inspect all your notices carefully upon their  
first appearance. In case of postponement, give the  
earliest notice possible at the office. When copy is received  
sufficiently early, a proof sheet will be furnished if desired.  
A revised copy rendered, for advertising at the mine, when  
requested. Neatly printed copies of advertisements, for  
individual notices to stockholders, printed and bound in  
hundred. Copies of the new advertising law, as officially  
published, furnished gratuitously. Blank forms, for  
filling out Assessment Notices and Delinquent Sales, sup-  
plied free to advertisers in the Mining and Scientific Press  
on application at the office.

DEWEY &amp; CO., Publishers.

505 Clay street, corner Sansome, San Francisco.

## New Mining Advertisements.

H. B. Osborn.....	230	50	\$12 50

And in accordance with law, and an order of the Board of  
Trustees, made on the fourteenth day of January, 1867,  
so many shares of each parcel of said stock as may be ne-  
cessary, will be sold at public auction, by Messrs. Olney &  
Co., at No. 418 Montgomery street, San Francisco, Cal. on the  
thirteenth day of March, 1867, at the hour of 2 o'clock P. M.  
of said day, to pay said delinquent assessment thereon,  
together with costs of advertising and expenses of sale.

R. S. CLYDE, Secretary.  
Office of Company, No. 532 Mercantile street, Room No. 3,  
San Francisco, California. feb23

Emelia Mining Company, State of Guerrero,  
Mexico.

Notice is hereby given, that at a meeting of the Board of  
Trustees of said Company, held on the twelfth day of  
February, 1867, an assessment of seventy-five cents per  
share was levied upon the capital stock of said Company,  
payable immediately, in United States gold and silver coin,  
to the Secretary, Room No. 1 Crim House, No. 523 Kearny  
street, San Francisco, California.

Any stock upon which said assessment shall remain un-  
paid on the twenty-second day of March, 1867, shall be  
deemed delinquent, and will be duly advertised for sale  
at public auction, and unless payment shall be made be-  
fore, will be sold on Monday, the eighth day of April, 1867,  
to pay the delinquent assessment, together with costs of  
advertising and expenses of sale. By order of the Board of  
Trustees.

MAX. BURCKHARDT, Secretary.  
Office, Room No. 1 Crim House, No. 523 Kearny street, San  
Francisco, Cal.

N. B.—The above assessment is levied in place of the as-  
sessment levied October 26th, 1865, which was revoked at a  
meeting of the Board of Trustees, held February 24th, 1867.  
All stockholders who have paid on the said assessment levied  
October 26th, 1865, will be credited the amount so paid  
on the assessment of February 24th, 1867. By order of the  
Board of Trustees.

MAX. BURCKHARDT, Secretary.

Kern River Gold and Silver Mining Company,  
Cove District, Kern County, California.

Notice.—There are delinquent upon the following de-  
scribed stock, on account of assessment levied on the  
third day of January, 1867, the several amounts set op-  
posite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
A. Staples.....	37	30	\$30 00

San Francisco, February 4, 1887. feb 9

**Caution!**

**Cosula Silver Mining Company.**—The following Certificates of Shares in the Capital Stock of the above named Company, were sold to pay delinquent assessment and expenses of advertisement and sale, on the eleventh day of February, 1887, at the auction rooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, at twelve o'clock, noon:

In name of	No. Certificate.	No. Shares.
P. J. Brogan.....	686	25
James Laddley.....	682	133
A. H. Murdock.....	683	25
I. D. Thompson.....	685	25

Parties are hereby cautioned against purchasing the above described Certificates of Stock.

CHAS. BAUM, Secretary.

Office, No. 610 Battery street, opposite the Custom House, San Francisco, Cal. feb 11

**Cherokee Flat Blue Gravel Mining Company, Cherokee Flat, near Oroville, Butte County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the twenty-fourth day of January, 1887, an assessment of five (\$5) dollars per share was levied upon the capital stock of said Company, payable immediately, in United States gold coin, to the Secretary, at the Company's office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, California.

Any stock upon which said assessment shall remain unpaid on the twenty-fifth day of February, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on the eighteenth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. DE SENALHAC, Secretary.

Office, southeast corner of Jackson and Montgomery streets, (up stairs) San Francisco, Cal. feb 2

**Camargo Gold and Silver Mining Company, Lander County, Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourteenth day of February, 1887, an assessment of twenty dollars per share was levied upon the capital stock of said Company, payable immediately, in United States Currency, to the Secretary, 402 Front street, San Francisco, Cal.  
Any stock upon which said assessment shall remain unpaid on the twenty-ninth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Tuesday, the twenty-first day of May, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

N. C. FASSETT, Secretary.

Office, 402 Front street, San Francisco. feb 16

**Postponements and Alterations.**—Secretaries are requested to give notice of postponements, or alterations which they may desire made in their advertisements at their earliest convenience. New advertisements should be sent in as early as possible.

The Mining and Scientific Press commenced a new volume January 3, on new type of California make—the first of the style, the editors say, which has yet appeared in print on this coast. It looks well.—Humboldt Register.

**Chippelon Mining Company—District of Ures, Sonora, Mexico.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the thirtieth day of January, 1887, an assessment of five dollars (\$5) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 318 California street, (up stairs) San Francisco, California.  
Any stock upon which said assessment shall remain unpaid on the eighth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the twenty-fifth day of March, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

JOHN F. LOHSE, Secretary.

Office, 318 California street, San Francisco, Cal. feb 2

**Diamond Copper Mining Company. Location: Rockland District, Del Norte County, California.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fourth day of February, 1887, an assessment of two dollars (\$2) per share was levied upon the capital stock of said Company, payable immediately in United States gold coin, to the Secretary, at the office of the Company, Room No. 33 Montgomery Block, San Francisco, or to ROSS B. RABALA, the Company's Superintendent, at Crescent City, Del Norte County, California.

Any stock upon which said assessment shall remain unpaid on Saturday, the ninth day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

Office, Room No. 33 Montgomery Block, corner of Montgomery and Washington streets, San Francisco, Cal. feb 9

**George Washington Gold and Silver Mining Company—Location of Works: Silver Mountain District, Alpine County, Cal.**

Assessment No. 17.

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifth day of February, 1887, an assessment of three dollars and fifty cents (\$3.50) per share was levied upon the capital stock of said Company, payable immediately in United States gold and silver coin, to the Secretary, at the office of the company, only.

Any stock upon which said assessment shall remain unpaid on the ninth (9th) day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Monday, the first day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

A. G. WOOD, Secretary.

Office, 338 Montgomery street, San Francisco. feb 9

**Julia Gold and Silver Mining Company, Storey County, State of Nevada.**

Notice.—There are delinquent, upon the following described stock on account of assessment levied on the tenth day of January, 1887, the several amounts set opposite the names of the respective shareholders, as follows:

Names.	No. Certificate.	No. Shares.	Amount.
Gasson, F.....	150	50	\$50 00
Perl Wagner.....	151, 152, 25-a	37	20 00
Lanzwever.....	153	20	20 00
Mackoon, B.....	155, 156, 25-a	50	50 00
Mibelle, J.....	39	10	10 00

And in accordance with law, and an order of the Board of Trustees, made on the tenth day of January, 1887, so many shares of each parcel of said stock as may be necessary, will be sold at public auction, at the salesrooms of Maurice Dore & Co., No. 327 Montgomery street, San Francisco, California, on the sixth day of March, 1887, at the hour of 12 o'clock, M., of said day, to pay said delinquent assessment thereon, together with costs of advertising and expenses of sale.

A. NOEL, Secretary.

Office, 607 Washington street, San Francisco, Cal. feb 16

**Mount Teabow Silver Mining Company—Location of Works: Cortez District, Lander County, State of Nevada.**

Notice is hereby given, that at a meeting of the Board of Trustees of said Company, held on the fifteenth day of February, 1887, an assessment of one dollar and fifty cents (\$1.50) per share was levied upon the capital stock of said Company, payable immediately, in United States gold and silver coin, to the Secretary, 331 Montgomery street, San Francisco.

Any stock upon which said assessment shall remain unpaid on the twenty-first (21st) day of March, 1887, shall be deemed delinquent, and will be duly advertised for sale at public auction, and unless payment shall be made before, will be sold on Thursday, the eleventh day of April, 1887, to pay the delinquent assessment, together with costs of advertising and expenses of sale. By order of the Board of Trustees.

R. N. VAN BRUNT, Secretary.

Office, 331 Montgomery street, San Francisco. feb 16

**North San Francisco Homestead and Railroad Association, at the City and County of San Francisco, Cal.**

Notice.—There are delinquent, upon the following described stock, on account of assessment levied on the eleventh day of January, 1887, the several amounts set opposite the names of the respective shareholders as follows:

## Machinery.

STEWART'S  
CELEBRATED HINGED  
Grinder and Amalgamator.

## Is the Cheapest and Quickest Pan

Now used. It is flat-bottomed, loses far less power in throwing the pulp, and circulates the same under the miller to better advantage than any other Pan in use, while the steam, owing to the thinness of the cone, has a more direct effect in heating the pulp. B is the miller plate; F the Grinding Shoe, attached by an adjustable hinge joint in the middle of the same—the bottom wearing down even with the dies.

Mr. J. H. STEWART, the inventor, has had ten years' experience in mechanical operations, and may be addressed at San Francisco, or called on at the Millers' Foundry, First street, where his Pan is manufactured, and is to be seen at any time in operation. 3v14tr

HUNTER'S  
IMPROVED CONCENTRATOR.

THE INVENTOR OF THE ABOVE RECENTLY IMPROVED Machine, is now prepared to take contracts for concentrating gold or silver ores on shares, receiving a certain per cent. of the sulphurets as may be agreed upon; and will guarantee twenty per cent. more sulphurets than from any rocker or concentrator built on the Pacific coast, saving at least ninety percent. of the sulphurets contained in the ore. The sulphurets, if de-fred for shipping, will contain less than one per cent. of sand.

Persons who have sulphurets ore will do well to have their sulphurets saved; as the many failures in mining can often be attributed to the waste of sulphurets. For particulars, address

3v14tr One of these Machines can be seen in operation at the Union Foundry, in this city, up stairs.

ANDREW HUNTER, Inventor,  
22v13-3m San Francisco.

VARNEY'S  
PATENT AMALGAMATOR.

## These Machines Stand Unrivaled.

For rapidly pulverizing and amalgamating ores, they have no equal. No effort has been, or will be, spared to have them constructed in the most perfect manner, and of the great number now in operation, not one has ever required repairs. The constant and increasing demand for them is sufficient evidence of their merits.

They are constructed so as to apply steam directly into the pulp, or with steam bottoms, as desired.

## This Amalgamator Operates as Follows:

The pan being filled, the motion of the miller forces the pulp to the center, where it is drawn down through the aperture and between the grinding surfaces. Thence it is thrown to the periphery into the quicksilver. The curved plates again draw it to the center, where it passes down, and to the circumference as before. Thus it is constantly passing in a regular flow between the grinding surfaces and into the quicksilver, until the ore is reduced to an impalpable powder, and the metal amalgamated.

Settlers made on the same principle excel all others. They bring the pulp so constantly and perfectly in contact with quicksilver, that the particles are rapidly and completely absorbed.

Mill men are invited to examine these pans and settlers for themselves, at the

PACIFIC FOUNDRY,  
1v1 San Francisco.

## Steam Pumps,

FOR DRAINING MINES OR ELEVATING WATER TO ANY HEIGHT.

PICKERING'S GOVERNORS

For Steam Engines.

Giffard's Injectors,

For Feeding Boilers.

STODDART'S IRON WORKS,

Beale Street, San Francisco,  
23v13-3m

STANDARD SOAP COMPANY'S  
WASHING POWDER.

THIS POWDER IS SUPERIOR TO ALL OTHER PREPARATIONS for washing and cleansing. It is made of pure material and contains nothing that will injure the finest fabric. Equally as good for use in hard or soft water. One pound will make three gallons of beautiful soft soap. Put up in wrappers of 1-lb each, and in wooden boxes of 10-lbs bulk. Ask your grocer for a package, and test its virtue. Manufactured at 207 Commercial street, San Francisco. 15v12m

## Brown's Filtering Heater!

FOR PREVENTING INCrustation IN STEAM BOILERS, purifies water from lime or any other impurity, saves fuel, saves the boiler, prevents explosions, and protects life and property. The cost of the Filter is soon saved in fuel and boiler-repairs alone.

One is in operation at the San Francisco Foundry, Fremont street, where Rights can be procured, or all needed information, on application, in person or by letter, to

AUSTIN A. WELLS, Agent.

## Brodie's Patented Improvements

FOR THE TREATMENT OF

## Gold and Silver Ores.

**BRODIE'S PATENTED IMPROVED QUARTZ CRUSHER.**  
The attention of all interested in Mining is respectfully called to this Improved Machine for Breaking or Spalling Quartz, or other Rock, possessing, as it does, simplicity of action and lightness of construction, so far as is compatible with strength and durability. In consequence of these advantages, the advertisers are enabled to offer these machines to the public at the following low terms:  
No. 1—Or 9-inch Crusher, capable of reducing from three to four tons of quartz per hour, no piece being larger than a walnut—price.....\$600  
No. 2—Or 15-inch Crusher, capable of similarly putting through five to six tons per hour.....550  
No. 3—Or 18-inch Crusher, will in a similar manner crush from seven to eight tons per hour.....1,200

## EXPLANATION OF THE ABOVE ENGRAVING.

The frame is made of cast iron, bound with heavy wrought iron bands, making it very strong, and at the same time light and portable. The crusher is bolted to a wood frame of sufficient height to clear the fly-wheel, and allow the crushed quartz to pass off. The dotted lines show the movable and stationary jaws. Letter A represents the eccentric shaft by which the power is applied direct to the movable jaw. B represents the movable jaw, and C the fixed jaw. D represents the link or radius bar. E represents the bolts for regulating the opening, F, which can be regulated at pleasure, so as to graduate the size to which it is intended the quartz shall be crushed. G represents the feed opening, by which the size of the machine is designated.

The arrow on the fly-wheel shows the direction to drive the eccentric, which, in combination with the link, D, gives the movable jaw, B, a forward and downward motion at the same time, and which makes the hardest rock yield and separate into fragments of any desired size.

The above Crushers have been recently erected and are now successfully employed at Bear Valley, Mariposa county, Rawhide Ranch, Tuolumne county, Excelsior Mine, Lake District, Nevada county, and can be seen in operation at the Fulton Foundry, First street, San Francisco.

The following testimonial respecting the effectiveness of this Crusher, has been received from the Superintendent of the "Rawhide Ranch" Mine, in Tuolumne county:

RAWHIDE RANCH, Tuolumne Co., Sept. 23, 1866.  
JAMES BRODIE, Esq., San Francisco.—My Dear Sir: It gives me pleasure to inform you that I have for the past three months had one of your largest sized Rock Crushers in use, at the Rawhide Ranch Mining Company's Mill, which has entirely met my expectations, and I have no hesitation in recommending it to all who are in need of a machine for rapidly, cheaply and properly preparing quartz for the stamps. Yours truly,  
Supt. Rawhide Ranch Quartz Mill.

**BRODIE'S PATENT IMPROVED GERMAN AMALGAMATING BARREL.**—This Barrel obtained a premium at the Fair of the Mechanics' Institute in San Francisco, in 1864. Further particulars will be afforded on application to the subscribers.  
Those infringing the patent rights to the above Improved Barrel, are hereby informed that on and after the 1st November, 1866, the royalty charged for using the same will be raised to the sum of \$100 per Barrel.  
A drawing and full description of this machine, will be found in the "Mining and Scientific Press," of September 29th, 1866.

**BRODIE'S PATENT WIND-BLAST SEPARATOR FOR DRY CRUSHING.**—This Dry Crusher has been found the most economical and effective mode of crushing ores in Mexico, California and Nevada. Diagrams and explanations afforded on application to the subscribers.  
A drawing and full description of this machine will be found in the Mining and Scientific Press of Sept. 23d, 1866.

## Hunt's California Pump

Has all the advantages of any other Pump, is one third cheaper and more durable, will draft water as deep and as force as high as any others, is not liable to get out of order, and is easily repaired by any one.

All these Pumps are fitted to work by hand if desired.

These Pumps have given good satisfaction to all who have used them during the last three years. Good judges have examined and pronounced them to be the cheapest and best Pumps in use.

Manufactured at Hunt's Windmill Factory, 23 Second Street and 110 Jessie Street.

Also, Tread Horse Powers, Pumping Frames for Irrigating, Saw Frames, Sweep Horse Powers and Frames, all in one frame, the horse to travel around the frame.

## PRICES OF HUNT'S CALIFORNIA PUMPS.

No. 3—3-inch cylinder, 6-inch stroke.....\$30 00  
No. 4—3 1/2-inch cylinder, 6-inch stroke.....35 00  
No. 5—4-inch cylinder, 6-inch stroke.....40 00  
No. 6—5-inch cylinder, 8-inch stroke.....45 00  
No. 8—8-inch cylinder, 12-inch stroke.....90 00  
A liberal discount made to the Trade.

BRUCKNER'S  
Mechanical Roasting Furnace

AWARDED A

## PREMIUM SILVER MEDAL

—BY THE—

The Mechanics' Institute.

Patented December, 1865.

THESE FURNACES ARE NOW MANUFACTURED AFTER an improved mode of construction, which GREATLY SIMPLIFIES THEIR OPERATION, and afford a much larger oxidizing surface to the action of heat and atmosphere.

The weight of a Furnace nine feet long by four feet in diameter does not exceed one ton.

## THE IMPROVED FURNACE

May be seen in operation, for desulphurizing or roasting and chloridizing, at Central Mill, Virginia City, Nevada.

Parties wishing to erect such Furnaces, are requested to leave their orders with

T. KALLENBERG,

15v12 416 Market street, San Francisco.

## To Quartz Miners and Others.

## NOTICE!

I WISH TO CALL YOUR ATTENTION TO A PULVERIZER of my own invention, which I have called the

## HITCHENS' ORE PULVERIZER.

It is now on exhibition at the Franklin Foundry, Fremont street. I am prepared to reduce, to an impalpable powder, quartz, sulphurets, tailings, cement, manganese, charcoal, sands, marble, plumbago, copper ores, etc.

In view of the importance of reducing ores, etc., to an impalpable powder, and being satisfied my invention to be a perfect success, I invite all interested in the subject to examine it. Patent applied for.

1v143m

JAMES HITCHENS.

## Notice to Miners,

## Well-Borers and Water Companies.

M. PRAG IS NOW PREPARED TO MANUFACTURE Hydraulic and Artesian Well Pipes in the best workmanlike manner, and at the lowest market rates. Having made large additions to my stock of machinery for that branch of business, I am prepared to fill all orders with dispatch, and guarantee entire satisfaction. I also manufacture Mississippi Stoves, of the latest improved patterns, for vessels of all classes. Also, Ship Plumbing done.

18v13-1y

## New Patents and Inventions.

Under this heading we shall mention, from week to week, as occasion may demand, New and Important Inventions; also, the List of Patent Claims recently issued from the U. S. Patent Office to inventors on the Pacific Coast, and other Patent Issues which we deem of local interest to readers on this side of the Continent. Most Patents on this coast are secured through the MINING AND SCIENTIFIC PRESS PATENT AGENCY. We are prepared to obtain from Washington, with despatch, copies of any Patent issued.

## RECENT INVENTIONS.

**HEADING AND THRESHING.**—The Oregonian speaks of the invention, by Mr. Davis, of Yamhill county, Oregon, of a combined header and thresher, which proved so eminently successful last fall, that the necessary steps have been taken to secure a patent for the same; while arrangements are at the same time being made at the Oregon Iron Works in Portland, for the immediate manufacture of a number of the machines. The utility of the invention will be fairly tested at the next season's harvest. The inventor claims that by the use of his machine, three persons with two horses, will cut, thrash and sack, ready for market, from twelve to eighteen acres of grain per day, at a cost not exceeding half that of any other machine.

**DEODORIZING DEVICE.**—A simple device has been invented in England for disinfecting and deodorizing the effluvia from sewers, drains and sinks. It consists of a wire screen filled with charcoal or other disinfectants, and placed so as to occupy the only outlet for the noxious gases, and compel them to pass through it. The same contrivance may also be placed in the rain pipes, so as to pass all the rainfall from the roofs through the disinfectant into the sewers. The London Board of Works adopted this plan during the late visitation of cholera; with what effect has not been reported.

**DEODORIZATION OF VULCANIZED RUBBER.** The offensive sulphurous smell of india-rubber goods, is a serious drawback upon their otherwise great convenience. Mr. Stephen Bourne, an Englishman, has patented a process for removing this odor by treating the fabrics in a heated chamber with charcoal, and in preference, animal charcoal, as more rapid in its effect. The operation may be conducted simultaneously with the vulcanizing; the apparatus required being very simple.

**A NEW ROCK-DRILLING MACHINE.**—The London journals announce the exhibition in one of the suburbs of that city of a contrivance invented by an English engineer, which he calls "patent tunneling and shaft-sinking machinery." This machinery is described as a small stone-drilling engine, placed upon an iron table, which is pivoted on the end of a horizontal arm. A cast-iron piece, consisting of two sockets placed and fixed rigidly at right angles with one another, connects this arm with a vertical column which is supported on a wrought-iron frame on wheels. This construction enables the drilling engine to be moved and placed so as to drill a hole in any direction. It weighs but 105 pounds, and the engine is worked with compressed air, the drill having both a forward and revolving motion. This drill is driven against the surface of the rock with great force and rapidity until a hole is made of sufficient depth for blasting. In five minutes it has scooped out a hole of six inches depth in solid rock; and it can be used not only horizontally, but at any angle. This machine is employed in France in several mines and quarries, and is said to be operated at but two-thirds the cost of hand labor in that country of low wages. This drill differs essentially from that in use on Mount Ceniz.

## PATENTS RECENTLY ISSUED.

**MACHINE FOR FINISHING LEATHER.**—Edward Fitzhenry and Isaac Ball, Portland, Oregon: We claim, 1st, The set-screws, D', and rod, D, with the springs, E, substantially as and for the purpose set forth. 2d, The plate, B, pivoted to the plates, A, so as to communicate motion to the rubbers centrally, and without pressing upon the springs attached to the sliders. 3d, In combination with the plate, B, we claim the rods, G, and pins, G', for the purpose of raising the sliders and brushes when not in action, substantially as set forth. 4th, The jaws, F, and I, hinged substantially as set forth, in combination with the hair-spring, I, substantially as and for the purpose set forth. 5th, In combination with the jaws, F, we claim the springs, K, and brushes, K', substantially as set forth. 6th, The cleaner, S, in combination with the sliders, F', operating substantially as and for the purpose set forth. 7th, The lever, L, and notched plates, O, or their equivalents, in combination with the rods, G, attached to the jaw, F, substantially as and for the purpose set forth. 8th, The arrangement of the points, M', so as to permit the raising of one or all the rubbers, substantially in the manner and for the purpose set forth.

**WAGES PROPORTIONED TO SKILL.**—From one of a series of articles in the Owyhee *Avalanche*, we extract the following: "The most intelligent and skillful workman will always perform the cheapest labor. A man that has had experience in different mines, or like any mechanic, has learned his trade, should occupy the same relative position that journeymen do to apprentices in any other business. The experienced miner is, in every sense of the word, as much a mechanic as the carpenter, machinist and blacksmith, and should be so considered."

\* \* The skill and judgment of the miner is a source of revenue to his employer in saving material. He will use less powder, will measure and cut his fuse the proper length, will destroy less hammer, pick and shovel handles, and will make all kinds of tools last longer than the inexperienced man."

\* \* My impression is, that persons who are new in the business should receive apprentices pay, until such time as they are able to do journeyman's work. I believe that it is impossible to make a true estimate of the value of a mining interest, unless intelligent and skillful labor can be employed, as it is impossible for any other to perform a regular task. \* \* Such men, however, demand all the comforts of life, and where the comforts cannot be supplied, the wages must be correspondingly larger to compensate them for this inconvenience."

**EARTHQUAKE IN NEW YORK.**—The Rochester *Union* says: "On Sunday afternoon and evening two distinct shocks of an earthquake were experienced in the southwest corner of this county and in the adjoining county of Livingston. The first shock came about 5 p. m., attended by a rumbling sound, which appeared to come up from the southwest and pass away to the northeast. Buildings were shaken in the village of Mumford, and people sitting in their houses were startled by the sensation produced. Between 8 and 9 p. m. another and a lighter shock was experienced. The first shock was sensibly experienced in the village of Caledonia, Livingston county."

**ROSS BROWNE.**—The clause in the appropriation bill devoting \$10,000 for another year to the "procuring of reliable statistical information" in regard to mining matters on the Pacific Coast, was stricken out by the House. Several attempts were made by Mr. Bidwell to have the matter reconsidered, but without success.

**TABOSE.**—In Mono, Tulare and Fresno counties, a peculiar root called by the Indians *Tabose*, is found. It has the flavor of a chestnut, and is a favorite food of Indians and gophers. It has been suggested that it would be as well worth cultivating by our farmers as the peanut.

**CASTOR BEAN.**—There are two varieties of castor bean. One, the white, produces about thirty bushels to the acre, and "pops" so as to lose half the product; the other, the red, produces seventy-five to eighty bushels to the acre, and *don't* pop.

## MELLVILLE C. KEITH, M. D.

Homeopathic Physician,  
No. 25 Montgomery st., opposite the Lick House, (Room 12,  
SAN FRANCISCO,  
Devotes special attention to CANCER, PARALYSIS and  
CHRONIC DISEASES. Consultation free.
